: >PVC is somewhat more lossy than some other plastics. One test

: It certainly is, I often use Teflon myself, to get lower losses.

From "Reference Data for Radio Engineers", Ch 4, Table 19 --
Characteristics of Insulating Materials:

Dissipation factor:
1 MHz 100 MHz 3 GHz
Aluminum Oxide (ceramic) .00033 .00030 .0010
Iron-sealing glass .0005 .0009 .00199
Polystyrene .00007 <.0001 .00033
Polycarbonate .010 - -
Polypropylene <.0005 - -
Nylon .0218 .0200 .0117
Teflon <.0002 <.0002 .00015
Epoxy resin (Araldite CN-501) .019 .034 .027
Bakelite B M 120 .0280 .0380 .0438
Butyl rubber .0010 .0010 .0009
Neoprene rubber .038 .090 .034
Douglas fir .026 .033 .027
Ruby mica .0003 .0002 .0003
Soil, loamy dry .018 - .0011
100% Polyvinyl-chloride (PVC) .0160 .0081 .0055

What is the significance of dissipation factor? It is the ratio
of energy lost to energy stored in a material. If you make a capacitor
insulator out of a material, the unloaded Q will be the reciprocal
of the material's dissipation factor (ignoring conductor losses).

Bottom line: Many plastics (including PVC) and other materials are
quite lossy at RF frequencies. The best inexpensive, commonly-
available material for coil forms, cavity resonators, etc. is
polystyrene, or possibly polypropylene. Unfortunately, both of
these plastics melt at high temperatures and are sensitive to
sunlight, so a good-quality but higher-cost alternative is Teflon.

Glass is good also, if the brittleness is not a problem.

One interesting note: Most PC boards are made up mostly of epoxy resin, with fiberglass for strength. Because of the epoxy, PC boards are quite lossy at RF.

I just use insulate wire when winding/mounting an antenna on PVC.

At VHF PVC isn't very good since it starts to absorb signal... but
at HF it should not be an issue.

4213. Help;Adding Mostar Channels?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 21:24:05 UTC
From: Brooks_michael@Tandem.com
Message-ID: <Brooks_michael-250693140819@130.252.109.65>
Source record: 279884

Hi,
I have a Motorola Mostar 8 channel radio. I have successfully been able to reprogram the 8 channels to 2m. I would like to now add more than 8 channels.
The radio uses a 2804 EEprom (512 bytes), this radio does not use all the address lines (since each channel is 32 bytes, 8 * 32 = 256 bytes and the high address lines are brought to ground).

I added a binary switch and changed the prom to a 2716 (2k bytes, the pinouts are the same, the 2804 has some unused pins). I use the binary switch to do bank selecting in the 2716. Using this method I should be able to get 8 banks of 8 frequencies (each frequency uses 32 bytes). This should be totally transparent to the radio as I haven't changed any of the internals, just bent up the extra address lines on the 2716 and brought them to a binary switch. However nothing I've tried seems to work. I've even had a friend re-wire everything as he felt it had to work and figured I screwed it up! Well, it doesn't work for him either.

Has anyone done this? Is there some hidden feature of the 2804 that makes it not really compatible with the 2716? Or worse yet did Motorola anticipate this type of modification and do something to prevent it? Any and all help would be appreciated.

Thanks,
Michael, N6UGX

> effectiveness. Apparently, my first positioning was just right. Now, of
> course, things have moved and I can't find the "sweet spot" again.

I noticed this somewhat too when I built mine (ok, not until the second
time I tuned it after doing a proper sodering job). Then, while browsing
an older copy of the ARRL antenna handbook, I saw where it said that the
feed should be balanced (makes sense if you think about it) and about
200-600 ohms. The author in that article recommended a 4:1 stepup ballan.

Elsewhere in that book it described the wiring as:
take an *electrical* half-wavelength of coax, short both ends of braid
together and connect to feed coax. Connect the center conductor to one
of the two centers from the half-wave coax and attach to one side, use
the other end's center conductor for the oppisite phase feed. Feed both
sides up a couple of inches from the bottom of the U.

I found that this circuit seemed to have a higher Q (lower bandwidth),
but got rid of most of the near-field coupling to the coax feed. Now
if I could just get the time to use it again :-)

Best of luck,
milton

Thanks. I found WR9R on 155.212.2.2 ftp site. Actually what I was looking for
was NA by K8CC, and I have been told it is commercial software. I was also
informed that CT now does Field Day, and I just verified with other memebrs
of our club that we have a current version, so my panic was for nought.
Thanks for all the quick response, and thank you Jim Reisert for the info on
CT and NA.
see you tomorrow!

Source record: 279885

I was the coordinator for the Lawrence Hall of Science SAREX contact that was almost pre-empted by Pres. Clinton. I haven't talked to anybody on the scheduling teams but I don't think that Clinton realised that he might stomp on our contact. As it worked out, we hung tight and he finished his chat with the crew and we had about five minutes to the start of our Hawaii ground station pass. I would guess that Clinton had a free half hour in his schedule at that point, his schedule people asked the NASA schedule people who said "Sure, we have an optional activity that we can reschedule." But that's just a wild guess. Clinton had a lot of very nice things to say about amateur radio and SAREX in particular. We were a little disappointed that the NASA Select TV folks didn't leave the Orbiter cabin cameras on during our contact. We had arranged to be able to watch NASA Select in case the crew cabin cameras were on. Instead we got to gnaw our knuckles through President Clinton's talk with the crew and then they showed something like "mission update". How boring 8)

The Malcolm X Intermediate school contact that was to immediately follow ours had problems. The ground stations in California, Texas, and Florida couldn't acquire a signal from Endeavour. I feel really sorry for those kids 8(They sat through the possible cancellation, through the LHS contact, and then had to watch ground station contacts disappear before their very eyes. Fortunately it looks like they can get rescheduled soon.

Disclaimer: These are my own, probably erroneous, ideas and statements. 8)

4217. SAREX Update

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 22:31:14 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <930625183114.2cc01b84@STDVAX.GSFC.NASA.GOV>
Source record: 279891

SB SAREX @ AMSAT $STS-57.011
SAREX Update, June 25 @ 22:30 UTC

SAREX School group operations have been on hold during the past two days due to the EURECA satellite retrieval and the spacewalk which was just completed. We still have 3 U.S. schools and 1 Australian school to complete.

Over the past 2 days, the SAREX team has heard no packet radio contacts over the mainland U.S. Prior to the sleep period yesterday, we asked for the crew to verify that the SAREX payload was configured for Robot Packet Operations. The crew response was that the packet robot was operational and that there was some packet activity earlier in the day. We have gotten a report that at least 30 packet connects have occurred; primarily over South Africa. Because of the intense activity today due to the spacewalk, we have been unable to get a clear definition of what the problem is with the packet robot. We will be working this problem as soon as the crew wakes up at 4/17:00. We will keep you informed.

If you are able to copy the packet robot, please let us know by sending me a short note on E-Mail at ka3hdo@amsat.org.

Submitted by Frank H. Bauer for the SAREX Working Group

4218. TS-700S Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 22:40:12 UTC
From: jeffh@ludwig.cc.uoregon.edu
Message-ID: <20fusc$dd8@pith.uoregon.edu>
Source record: 279889

I have just gotten the usage of a ts-700 for an indefinite amount of
time...It has the external VFO but not the plug to put in the VFO socket
when the external VFO is not being used. I went thru the schematic and
service manual but was unable to find a diagram for the plug wiring.
Anyone out there have one they could check out and e-mail me the wiring
scheme for the plug?
Thanks in advance!

Assuming the $50 is not out of budget, a good
antenna for multiple band work, including scanning,
is the Radio Shack discone.

It is reasonable well made, portable and
easily assembled and has an eseentially
flat SWR from 144 through 2 gigahertz.

Since the most benefit of an external
antenna is just the virtue of getting
it above the local obstructions, not
from the gain of the antenna itself,
the unity gain of the is no big deal.

You are still getting the 10+ dB gain
from just getting your antenna in the air.

So why don't you use microwave safe plastic dishes to make
standoffs? Wouldn't this be the logical conclusion from
your test results?

**Chart from an Al Bloom N1AL Posting
>From "Reference Data for Radio Engineers", Ch 4, Table 19 --
Characteristics of Insulating Materials:

Dissipation factor:
1 MHz 100 MHz 3 GHz
Aluminum Oxide (ceramic) .00033 .00030 .0010
Iron-sealing glass .0005 .0009 .00199
Polystyrene .00007 <.0001 .00033
Polycarbonate .010 - -
Polypropylene <.0005 - -
Nylon .0218 .0200 .0117
Teflon <.0002 <.0002 .00015
Epoxy resin (Araldite CN-501) .019 .034 .027
Bakelite B M 120 .0280 .0380 .0438
Butyl rubber .0010 .0010 .0009
Neoprene rubber .038 .090 .034
Douglas fir .026 .033 .027
Ruby mica .0003 .0002 .0003
Soil, loamy dry .018 - .0011
100% Polyvinyl-chloride (PVC) .0160 .0081 .0055

Looks like you are right Gary, PVC losses to tend to
be pretty frequency sensitive--its a bit *worse* than
might be predicted from the microwave oven test.

We should all keep in mind that a *broken* insulator is
often worse than a lossy one. While a fraction of a dB
may be statistically significant over the long term, you
can often work more stations with a *reliable* station,
than a marginally louder one.

Smart design can often mitigate the loss problem. I used
Lexan as a center insulator on my portable 6 meter beam.
While its too lossy to bother putting on the charts at VHF+,
it probably doesn't matter, since the feedpoint impedance
is only 25 ohms. However, I wouldn't use it to support
VHF quad loops a quarter wavelength from the feedpoint (or
perhaps more descriptively, horizontal spreaders for a
horizontally polarized quad.) It would make much more
sense to place the supports at the current nodes (vertical
spreaders).

Similarly, one might expect little loss using PVC to support
yagi elements at the center, since they are being supported
at low impedance points.

Perhaps the worse place to use PVC is at the inductor/capacitor
junctions of tuned circuits--these are often high impedance points.

Given the electrical/mechanical tradeoffs, PVC is probably the
best choice, followed by wood (which is even worse electrically!),
assuming you don't have much in the way of tools/mechanical skills.

Those with a good shop should probably consider using aircraft
aluminum (which often requires a more complicated mechanical/electrical
design to deal with a good conductor, as opposed to a convenient
insulator). Unfortunately, switching from one to another (conductive/
nonconductive booms) often requires changing the element lengths as well.
Aluminum antennas tend to be a lighter and more rugged, due to the
better mechanical properties of the material.

Source record: 279896
Cross-posted to: rec.audio,rec.radio.amateur.misc,sci.electronics

About a year ago a voltage surge from my tape deck knocked out the right channel in my Technics receiver. I figure that it probably shouldn't be too hard to fix-- most likely a chip or other rather sensitive semi-conductor was fried. Actually, the problem corrected itself after a long period of rest. Unfortunately, when adjusting the volume one day, a static charge from my finger apparently zapped it for good.

Since the receiver is about ten years old, I'm not especially eager to spend a lot on getting it fixed. Although I'm no electronics expert, I have enough technical skill that I could fix it myself if I had a better idea of where to start. Does anyone have any suggestions on how I might go about isolating the faulty component(s)?

>If anyone out there can help with more specific suggestion where to look, we
>would appreciate it.

- junk from the power supply; look at it with a scope;
- RF spray into controller or power supply, check
shielding and ground bonding, check for failed
tantalum bypass capacitors;
- a watchdog timer which is flaky; our WB3ESS
controller upgraded the watchdog from a 4098/4538
CMOS monostable to a top-notch MAX699 made for the job.

It's almost always something simple and belatedly obvious, though.
Likely a loose screw which provides a ground to a portion of
circuit board somewhere. Something which makes you feel a
little silly when you find it. :)

4224. Re: Broadcast IDs

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-26 13:22:34 UTC
From: Paul_Albert_Strater@cup.portal.com
Message-ID: <84123@cup.portal.com>
Source record: 279899

Wow! Are there a lot of somewhat incorrect opinions about what constitutes[B[
a legal ID for American Broadcast stations! As a former Chief Engineer
(currrently assistant chief) I've been going around and around with program
directors for years on this. First, I'll quote chapter and verse from the
federal regs as they appear inprint...

47 CFR 73.1201

73.1201 Station Identification.

(a) When regularly required. Broadcast station identification announcements
shall be made: (1) At the beginning and ending of each time of operation, and
(2) hourly, as close to the top of the hour as feasible, at a natural break
in program offerings. Television broadcast station may make these announcemen
either visually or aurally.

(b) content. (1) Official station identification chall consist of the station
call letters immediately followed by the community or connunities specified in
its license as the station's location: Provided, That the name of the licensee
or the station's frequency or channel number or both, as stated on the station
license may be insertedbetween the call letters and station location. No othe
insertion is permissible.

(2) A station may include in its official station identification the name of
any additional cany additional community or communities, but the name of the c
the sthe station is licensed must be named first.

WHAT THIS ALL MEANS: On your station's license (it's hanging at the primary
control point, ISN'T IT??) you will find "CALL SIGN" and "CITY OF LICENSE"
These are the only elements necessary for a legal ID. "This is WXXX Small-
ville" constitutes a legal ID. Actually, you could even leave out the
"this is" part. Call sign, immediately followed by city of license. That's
all you need. Now, the following are also legal:

WABC, 770 kilohertz, Capital Cities/ABC, New York
WCFL Joliet Chicago
WGAR 99.5 Cleveland
WMAQ, Group W, Chicago

The following are NOT legal:
WRQN is licensec to Bowling green, Ohio. It considers itself a toledo, Ohio
station. It tries like hell to ignore its city ofilicense.
"WRQN Toledo Bowling Green"
NOT legal because its city of license did not come first.

WJMO-FM, Jammin' 92, Cleveland Heights, Ohio
can't do that, your "handle" has no place in a legal ID.

WHEN SHOULD I ID?

Look at the first paragraph. Seems simple, doesn't it? You'd be surprised how many program directors can't seem to grasp that rediculously simple cconcept. According to the FCC, and the NAB legal department, the ID comes just as it says, as close to the hour as possible, at a natural break. SO many station "bury" their ID between commercials at around quarter of. The are usually the stations that are licensed outside of a major city, but consider themselves IN that city. They're ashamed, unwilling, or unaware of thei station's heritage. Z-100, New York City, used to (I haven;t heard them in a while) used to throw the ID in, under tons of laser shots and other sound effects, at quarter of in a commercial break. It said "WHTZ Newark New York" but the "Newark" was prodounced in such a way that it sounded like "New York" so the ID, if you could make it out at all, sounded like "WHTX New York, New York" (oops, that was WHTZ, typo!). By the way, the end of a record i considered a natural break. Sorry. Hope this clears up the misnomers.

Sadly, CQ bought the late great _Ham Radio_ and drove a wooden stake through it's heart. It is no more. Subscribers received that piece of fluff CQ laughingly calls a magazine to fill out the subscriptions. However, CQ does now publish an overpriced quarterly called, unimaginatively, _Communications Quarterly_. It started out well, but seems to be dumbing down with time.

>Basically, what I'm looking for is a periodic pubblication with fairly high
>technical contents with also minor entries for other stuff like contesting
>dxing etc. and would appreciate any comment about the above one plus
>any suggestion other magazine especially 73.

>regarding tech articles. I also had a chance to take a look to QEX but it
>misses non-technical sections plus it's quite expensive for non-us subscribers.
>
>Any suggestion is very welcome....

Marco, you may have to look for non-US publications to meet your needs. Now that _Ham Radio_ is gone, there are no consistently high quality technical ham radio monthlies left in the US. 73 Magazine is interesting. It rarely gets very technical, but it does offer a lot of simpler projects. And then there are Wayne's editorials. They're always good for getting the juices flowing. Jon Bloom is trying to find a niche for QEX, but it hasn't lived up to it's original billing (not Jon's fault), and it really hasn't found a new direction yet. QST is the best of a bad lot. It often has 5 or 6 pages of useful material wedged into the front of the catalog. If we could subscribe to just those pages, a lot of trees would be spared. :-)

From: gary@ke4zv.uucp
Message-ID: <1993Jun26.145212.14836@ke4zv.uucp>
Source record: 279902

In article <1993Jun25.124135.4506@uoft02.utoledo.edu> mohan@tulip.es.utoledo.edu writes:
> Can someone here give me some info regarding the following:
>
>1. What is the difference of having a transceiver and separate transmitter and
>receiver setup. Can you tell me the comparision of such setups.

At one time, all ham stations had separate receivers and transmitters.
Now almost everything is a transceiver. The separates offered more
flexibility, and often more raw performance and, of course, more knobs.
But, the extra cost of two cabinets, two power supplies, and other
duplicated circuitry made the transceiver the more economical choice.
The real operational difference between the two is that the separates
naturally operate split while the transceiver operates tracked. Now
some twins can be slaved together, and most transceivers today can
operate split, so the operational differences are small.

>2. Also what do you think about the Collins. The person selling the Collins
>asked about $550 for the transmitter+Receiver+Powersupply. Is this ok price?

Collins equipment was well built for it's day, and the S-line remains
popular among "tradition" minded amateurs. Collins equipment has some
collector value, so the price is not out of line for a set in good
condition. As basic radios they can still hold their own with the modern
entries, but vacuum tubes are becoming harder to find and the solid state
conversions that were available are less than satisfactory. Of course none
of the taken for granted modern features such as memories, digital readouts,
built in keyers, and the like are present. These are basic workhorse radios.
The Collins mechanical filter was a major innovation in it's day, and still
makes their receivers very usable.

The Drake twins, the T4X and R4C, were the competition to the Collins
S-line. They are also sturdy radios that operate well. *Their* innovation
of passband tuning is still a very useful receiver feature. They can
often be found at slightly lower prices than the Collins gear, in the
$350-$450 range.

Both companies also made transceivers. The Collins transceiver of note
is the KWM-2, and the Drake model is the TR4CW. They both made others,
but these are the most popular. They require external VFOs to operate
split. Kenwood also made a set of twins to compete with the S-line
and Drake Twins, but these were less successful hybrid units. They
did make a workhorse transceiver, the TS520, that is still in use
at many ham stations.

Of course today there are a wide range of good transceivers on the
market by Icom, Kenwood, Yaesu, and TenTec. Any of them is usable,

but I like the Icom IC-735 the best for delivering the most value for the dollar. Major DXers prefer the Kenwood TS950, the Yeasu FT1000, and the Icom IC-781, but the performance increase over the 735 that these radios offer is marginal when compared to the price differential. Lately, there have been some "simplified" entries in the HF transceiver market aimed at people intimidated by knobs. As you progress, you're likely to find the lack of those knobs limiting.

>I have 2 questions:
>
>1. Is the J pole a directional antenna?

Yes, but not intentionally. :-(
The asymetric feed, and the often strong feedline radiation tend to
skew the pattern. There are installation dependent fixes that can
minimize these problems.

>2.Do FM broadcasters (in the broadcast band) usually use vertical polarization?
> Would this imply that if I use a dipole antenna that I should string it up
> and down instead of horizontally?

The broadcast standard is horizontal polarization, but the practice at
the vast majority of stations is to run circular polarization. This allows
good reception by horizontal home antennas and by vertical auto antennas.
Vertically polarized antennas will usually be plagued by multipath to a
larger degree than horizontal antennas due to the tendency for most radio
reflectors in the environment to be vertical structures.

>about isolating the faulty component(s)?

Since you have a working copy of the circuit to compare, the left channel,
fixing this problem is rather straight forward. A good place to start
looking is at the volume control. This is usually about halfway through
the circuitry. If you have signal on the wiper of the left channel, but
not the right, you can move back into the preamps. If signal is present
for both, you can move forward into the power amps. A scope is real
handy for this work, but not absolutely necessary. All you really need
is a pair of high impedance headphones, a coupling capacitor, and a
VOM. You use the headphones to listen for signals, the coupling capacitor,
10 uf will do, for isolating the headphones from DC, and the VOM to do
component checks. When you find the stage with signal going in, but none
coming out, then all you have to do is check components to find the
faulty one.

4230. vlf-konverter

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-26 15:30:00 UTC
From: carsten@aworld.aworld.de
Message-ID: <53_1E000QQ471jj@aw27.aworld.aworld.de>
Source record: 279926

hello,

i want to build a converter for vlf (50KHz - 150KHz) to any 'normal'
shortwave-frequency.
although i have experience with electronic circuits i do not know how
to make such a converter.
i hope somebody can help me.

4232. New ham archive site / callsign server

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-26 17:14:57 UTC
From: root@multiop.com
Message-ID: <19ak1981a@multiop.com>
Source record: 279905

A new ham-radio archive site and callsign server center has been set up
on the Internet.

The Buckmaster CD-ROM callsign database (which includes international
calls) and all the Buckmaster CD-ROM public domain files are available
for retrieval!

To access the Buckmaster callsign server

rlogin/telnet: 155.212.2.2 (or, ns.risc.net)
login as: hamradio (no password)

To access the file archives:

ftp to: 155.212.2.2
login as: ftp / anonymous
password: your email address

The buckmaster files are located in ~/ham-radio"

For some reason, the folks there changed the ftp login. It used to be
"hamfiles", but that doesn't work anymore. All of the buckmaster files
are still accessable through their anonymous FTP login, though. I
sent e-mail to the sysadmin asking why but haven't gotten a response
yet.

[deletions]

Not sure what the asterisks around *Their* are supposed to connote in this passage -- not, I hope, that Drake developed passband tuning, or that Drake developed so-called "electronic" passband tuning. As far as I know, Collins introduced passband tuning (in the 75A-4) by mechanically linking the BFO and main PTOs to keep received pitches the same while apparently moving selectivity around. This system works amazingly well, esp considering the possibility for misalignment.

Drake later did passband tuning *another* mechanical hard way -- by simultaneously tuning several 50-kHz IF circuits -- up through the R-4B, and in the 2-line.

As far as I know, however, it was first Alvernaz (in "A Novel Side-Band Selector System," May 1958 *QST*) who described electronic passband tuning as we know it today: "scanning" an IF filter around by converting and deconverting the received signal with the same oscillator. But I agree that, as far as I know, Drake was the first to put electronic passband tuning into an Amateur Radio product (the R-4C). This how everyone who's doing *real* passband tuning -- moving a fixed bandwidth around without changing the pitch of received signals -- does it these days.

If, by those asterisks, you're indirectly calling attention to a particular manufacturer's ongoing choice of using the term *passband tuning* to refer to a form a bandwidth adjustment by electrically scissoring the passbands of two filters, that's a change of subject in the sense that the two features cannot (fairly) be directly compared; each has its place when the going gets tough. But I can comment on the begged question: That it *is* an unfortunate nomenclature choice -- made for whatever reason -- because it confuses. And of course, whatever it's called, the misnamed feature itself is not an innovation, since Kenwood (at least) had electronically variable IF selectivity in an Amateur Radio product earlier (no later than the TS-830).

It is *also* not an innovation because, so far as I know, it was Atkins (in "A Selective 21-Mc. Converter," Apr 1959 *QST*) who first described such electronically variable IF selectivity.

Source record: 279909

SB SAREX @ AMSAT $STS-57.013
STS-57 East Coast Rise/Set Times, June 26-29

Below are the rise and set times for STS-57 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

This data should remain valid unless there are additional engine burns. We
regret that the frequent rocket engine firings during the first half of
the STS-57 mission made it impossible to generate rise and set predictions
that would not be invalid by the time they could be distributed.

SB SAREX@AMSAT $STS-57.015
STS-57 Western US Rise/Set Times, June 26-29

Below are the rise and set times for STS-57 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

This data should remain valid unless there are additional engine burns. We
regret that the frequent rocket engine firings during the first half of
the STS-57 mission made it impossible to generate rise and set predictions
that would not be invalid by the time they could be distributed.

4236. SAREX Update 6/26/93

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-26 23:27:50 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <930626192750.2cc02276@STDVAX.GSFC.NASA.GOV>
Source record: 279910

SB SAREX @ AMSAT $STS-57.017
SAREX Update 6/26/93 at 22:45 UTC

The SAREX team has been hard at work trying to reschedule the remaining school groups with the Mission Control Team. 2 of the three remaining schools have firm schedules at this time.

We have been working especially hard to ensure that the packet robot is turned on for your use. The packet radio system was turned on to robot mode this morning. Pilot Brian Duffy, N5WQW, sent beacon text which included an apology for not having the packet system on over the past two days. He stated that they have been very busy on the Shuttle and this prevented him from configuring the TNC. Later in the day, the team got reports that the Packet robot was not turned on during a pass over Hawaii. Based on this information, we requested that the packet system be turned on again. As best as we can tell, SAREX should be configured for robot packet ops with a downlink frequency of 145.55 MHz and an uplink of 144.49 MHz. The packet callsign is W5RRR-1.

We have also gotten some reports from hams in the U.S. who have talked to Brian Duffy on voice this morning on 145.55. Remember that the voice uplinks for SAREX are 144.91, 144.93, 144.95, 144.97 and 144.99 except in Europe where the uplink frequencies are 144.70, 144.75 and 144.80.

The SAREX team wishes you the best of luck in making a contact with the Shuttle crew.

And, when I checked with ARRL concerning a FD exchange for the Shuttle crew to use when operating during Field Day, I was told to tell 'em, "Space" for a section... Guess we need to get a new SM now!

4238. Ham Radio Services @ NS.RISC.NET

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-27 05:03:43 UTC
From: phil@multiop.com
Message-ID: <129128a121a93@multiop.com>
Source record: 279912

I was looking around the ham radio archives at NS.RISC.NET and look what
I stumbled across!

---

* RISC.NET Ham Radio Server *

RISC.NET has established a series of services which all radio amateurs can
access. These services currently include access to the Buckmaster CD ROM
public domain files in addition to the Buckmaster callsign database.

Additional information can be obtained by writing to: root@ns.risc.net

This file contains information on:

1. Accessing RISC.NET's callsign database
2. Accessing RISC.NET's public domain shareware database

==========
1. ACCESSING THE BUCKMASTER CD-ROM CALLSIGN DATABASE

The Buckmaster Callsign Database is accessed by logging into a special account
called "hamradio". From this account, you can access the Buckmaster CD-ROM
callsign database (only the US calls at this point, as the international
database is encrypted and Buckmaster will not provide the key so we can
create a UNIX version of their ICALL.EXE program - if anyone knows how to
decrypt this data, please contact us!) or you can TELNET to the Buffalo or
NJIT callsign databases.

Procedure:

Telnet or rlogin to "155.212.2.2" (or, "ns.risc.net")
Login with user-id "hamradio". No password is required.

At this point the system is self-explanatory.

==========
2. ACCESSING THE BUCKMASTER CD-ROM PUBLIC DOMAIN SHAREWARE

The Buckmaster PD Software Library can be accessed in one of the following
manners: UUCP, FTP, or Mail-based archive server. A complete list of all
files available for transfer may be obtained by retrieving file:

!~/ham-radio/mascd.dir

Anonymous UUCP Information:

Telebit Trailblazer Plus Dial-In: 1.401.455.0347
9600 to 300bps v.32/v.42 Dial-In: 1.401.331.3706
ns.risc.net!login: xxcp
Password: xenix

To download a file, issue the following uucp request on your machine:

uucp anomaly!~/ham-radio/files/<filename> yoursite!<to-filename>

All files are stored in /usr/spool/uucppublic/ham-radio/files on RISC.NET's Archive.

Mail-based Archive Server:

To answer the interim demand of people on the Internet who wish access to the ham radio files, we have established a mail-based server which can process requests for files. Note that in order to keep our SMTP connection from getting bogged down, we only process *5* megabytes worth of software requests PER DAY. Users with alternative means of obtaining files are encouraged to do so.

To receive instructions on how to use the mail-based archive server, send an e-mail message to "snarf@ns.risc.net", with a Subject: of 'snarf' and the following two lines starting in column 1:

snarf address [your e-mail address]
snarf help

For example:

snarf address wb9aaz@gello.pcb.org
snarf help

These commands will forward a help file to your reply address. This help file contains all information you require on how to obtain software listings and uuencoded mailings of archive contents.

Note that if you do not have an address line, or you have other errors in the body of your text, you will not get a reply from the server.

Zmodem/Ymodem/Xmodem/Kermit/Sealink:

All files can be accessed from RISC.NET's "bbs" login, for those users without UUCP or FTP access. Validation is required to access the file sections, though, so on your first call leave a note in FEEDBACK stating that you're calling to download from the ham-radio archive, and we'll see that you get an special access account.

FTP Access:

Our IP Address is: 155.212.2.2! Or, for those of you with Nameservers, try
"ns.risc.net"! As with our SMTP connection, the number of FTP users
we allow on our link is also limited to prevent net-congestion. If you
receive an "all ports are currently in use" message, please try again later.
Login using anonymous FTP account "ftp", and your e-mail address for a
password!

4239. Macintosh Ham Software?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-27 05:27:50 UTC
From: David Van Nuys <vannuysd@sonoma.edu>
Message-ID: <1993Jun26.222751.5696@nic.csu.net>
Source record: 279913

I notice most or all of the software for Ham use seems to assume IBM-compatibility. I have a Mac, however. What do hams with Macs do for packet, sattelite work, and so on. I suppose one approach would be to use a program like Soft PC to emulate an IBM and run the software. Anybody doing that with any success? Or are there FTP sites with Mac software for hams?

4241. Need specs on Heath Phone Patch VU meter.

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-27 15:11:22 UTC
From: kshus@schunix.dmc.com
Message-ID: <1993Jun27.151122.11893@schunix.dmc.com>
Source record: 279927

I picked up a Heathkit HD 15 Hybrid Phone patch. The VU meter has been severely damaged, and I want to replace it with a new one. Fair Radio offers a number of reasonably priced vu meters, but I need to know the ma rating, the resistance and other such specs. Heathkit has not been helpful, nor do they stock spares. I don't want to end up spending $20 for the meter. Can anyone provide specs? Thanks Chris

4242. Whatever happened to VHF AM??

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-27 15:18:34 UTC
From: psthomas@nyx.cs.du.edu
Message-ID: <1993Jun27.151834.26783@mnemosyne.cs.du.edu>
Source record: 279917

Last October, at the local hamfair, I became the proud owner of a Hallicrafters SR 42A -- a 2m AM transceiver. The radio seems pretty nice and is almost certainly operational, but there's just nobody out there to talk to. Are there any 2m AM nets? Anybody with 2m AM DX?

I had (and, I think, still have) the possibility to get my claws into a 2m/6m AM transceiver, which I'd like (I enjoy somewhat obsolete equipment, including tube-based audio amplifiers, and teletype machines), but I don't know if there's anybody out there to talk with on 6m AM either.

Can anybody offer any suggestions? Should I just give in and buy a transverter for SSB/CW on 6/2, or is there any hope for VHF AM?

Incidentally, I'd also be appreciative if anybody could relate any statistics on my 42A... I'm not quite sure what it's capable of.

Thanks!

From: rbisbey@eis.calstate.edu
Message-ID: <C9AGup.Dqq@eis.calstate.edu>
Source record: 279925

I purchased a Buckmaster CDROM at our local hamradio swapmeet, and went looking at the commercial license databases for AM/FM/TV. I didn't find a file containing the DB formats on the disk. I can figure out the record-length and many of the fields from the data, but having the DB formats handy would make things simpler. Does anyone have 'em?

My thanks to all who responded! I picked up a MVT-7100 "assault" scanner while in Amsterdam last week. After VAT refund, the cost was about $US480. I especially thank the .nl folks who directed me to the dealors that carried it, so I would be able to see one, without spending time I didn't have searching for a stocking dealor.

It's a great radio, well worth the money. I put it on the com monitor at my Eindhoven office, and it beats all it's specs by a wide margin, and about matches the test specs I saw "published" here. There are a very few spurs from the CPU that are recieved, these require more signal to overcome, and may be the source of the Yupiteru specs. One of the strongest was at 949.1Mhz , and required 1.37uv to get 12db sinad, which is still not too bad. 999 Mhz (the highest the monitor went) was .19uv for 12db sinad, which is more typical of the reciever in that band. Measured 6db bandwidth is 14.88 Khz in narrow FM with a -1.85 khz freq offset (error). The WFM bandwidth is 47.9Khz, again at the 6db points. AM sensitivity at 2 Mhz is .35uv for 12 db sinad, and .13 uv at 120.1 Mhz (aircraft band).

Those were the only measurements I had time to print out. I tested other points, and found the radio to be very consistant.

I have a Kantronics KAM for sale.

It has the version 5.0 firmware, and includes documentation and
cables.
It's in excellent condition and I'm the original owner. Includes the
factory installed mod for connecting an oscilloscope to the unit for
received signal monitoring.

Price is $180 plus UPS or whatever shipping method you wish.

Call (603)889-1067 anytime. Responses on the net will probably not
reach
me.

4250. Which are the present day "Good HF Rigs"

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-27 20:21:56 UTC
From: mohan@tulip
Message-ID: <1993Jun27.152157.4528@uoft02.utoledo.edu>
Source record: 279923

Hello,

In an article titled "Equipping your first ham station" in QST of July 1985,
the author refers to the following as rigs which can serve well for a novice
and technician. The rigs named are :

Yaesu FT-101B, EE or E series
Drake TR-3 or TR-4
Kenwood TS-520
Ten-Tec Tritron 4 and its successor
Heath SB-100 or SB-101.

So, my question is the above list was made in 1985. If someone made a list now
what rigs will qualify in the same class. I need such info to choose a model
as my first HF rig. I will a summarize the responces to this newsgroup.

Thank you very much :)

I operated Field Day in class 1D (home station, commercial power) from here in Tempe, Arizona.

Propagation, to put it nicely, STUNK!!!

I only operated 6M and 10M, but listened on the other bands, and it seems like they had it no better.

So, how about it folks? How did it go in other parts of the country? (From what I heard on "Spectrum" on WWCR Saturday night, it was bad everywhere!)

<deletions>

If you've got access to a newstand that carrys British publications,
you might want to check out "Electronics and Wireless World" - much
stiffer technical content than any of the American mass-market
magazines I've seen. Only drawback is that its a bit steep; its
almost $9 Canadian a copy and when you add our brilliant government's
tax on literacy makes the price a real barrier. Pool a subscription
with two or three trusted friends and it would be all right. There
was a recent series on GPS recievers, and using a DSP to do SSB. There
are non-radio-related articles as well. No contest news.

Message-ID: <1993Jun28.002101.27578@uhura.neoucom.edu>
Source record: 279830

Field day was pretty good here in Kent, Ohio. I used an 80m 1/2 wave dipole strung between two trees about 10 meters above ground. I worked 75m phone and 10m phone under the callsign N8MC 5A/Ohio. I had lots of nice contacts on 75m both Saturday and Sunday running from my Kenwood TS-440S/AT running a Max of 100 watts. I ran solar power on Saturday afternoon and made 18 contacts on 75m. I could have made more contacts, but I ran out of daylight.

10 meters was good on Sunday morning from about 15:00-18:00 UTC. I made lots of contacts in regions 4, 5, and 0. The longest distance contact was to Colorado. Most contacts were in region 5 to North Texas and Alabama. I heard a LU2 station from Argentina from quite some time on ~28.47 MHz, but my TS-440 didn't have enough guts to get past the big guns in the pile-up. Several stations near me running higher power managed to log LU2. All this was with a dipole that was too long and too close to the ground; no fancy beams or high power.

My rating for this year's field day was pretty good. Even a Novice 1D station would have had a pretty fun time on 10m here in Ohio.

73,
Bill

4257. my DJ580T lost UHF RX...

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-28 02:46:19 UTC
From: hemstree@lamar.acns.colostate.edu
Message-ID: <HEMSTREE.93Jun27214619@lamar.lamar.acns.colostate.edu>
Source record: 279831

I have had my DJ580T for about 15 months now. I performed the
red wire mod on its brain when I bought it. The extended receive
works fine. Now the sad part...

I have lost the receive capability on my UHF side. Well, I thought of
just about everything I can and I am now at a dead end.

So far I have:

changed antennas
changed batteries
reset the radio via Function-Power

The VHF side is still behaving properly, but for how long? BTW: the UHF
side still transmits, very well I might add.

Has anyone heard or seen of this problem? Any recommendations?

Thanks for the help,
Charles N0TQJ

Some comments about Field Day. It's not what we think it is. How many stations just sat there in their basement or shack operating with a friend or two? How many stations did I hear calling "CQ CONTEST"? Field Day as I've interpreted it, is supposed to test your readiness in case of emergency, to see if you could operate without commercial power sources, or at different locations.

But no, the ARRL decides to make it a contest thereby cluttering up the HF bands. I had never heard so many rude and inconsiderate people than on Field Day.

Here's what KD1HZ and I agreed on. Why doesn't the ARRL set aside the bottom 10kc of each sub-band (gen/adv/extra) for normal QSO's and the rest can be the contest garbage. That way hams like myself who really don't like the contests can have a place to carry on normal QSO's. But then, you'd get those hams with Henry 3KW amps and beams.... and we all know where THEY are. :)

If it were a perfect world we wouldn't have to put up with anything. :(

>on their design, i.e. element spacing, loop length, and the like.
>

I have posted this stuff before. I have a xerox of a QST page 34, but no date. On much of the Quagi stuff I have from QST, there are no dates on any of the pages. The reason for this is that the left hand page has page number and the QST logo. The right hand page has the page number and the date. Could the Editor of QST fix this and ID and date all pages?

I assume it is sometime around 1978. The headline says "Additional Bands for the Quagi" The article explains how to scale a quagi.

I have typed this in before, I am sure it is archived in the QST CD-ROM.

Maybe someone could grep through the rec.radio.amateur.misc stuff of the past and dig it up.

: can find! I want to put a quarter wave cb antenae up in a tree, is there
: an optimum length for the coax and where is the trade off point between

The length of coax does not matter. The diameter does not matter.
By far the most important consideration is to get your attenna up at least
30-50 ft. (whatever the CB regs permit) and to get it as far as possible
from metal objects like rain gutters, metal structures, etc.

You might consider leafing through the Technician's amateur question pool
available at Radio Shack to see hour easy it really is to get an amateur
ticket and have a whole lot more fun once CB radio whets your appetite but
perhaps fosters an urge to get away from rude baboons. (You meet a much
more refined set of rude baboons in the amateur bands. :-))

Well, Patrick, there is a reason why some people refer to AM
as "Ancient Modulation". I haven't heard anyone operate AM
on 2M since about 12 years ago when I coaxed someone into
working me on an older Heathkit Twoer.

There must be someone out there that still works AM on 2, but
its getting pretty sparse.

We had it pretty good here....our Club station W4IKR was kicking butt!
Although, we were 2A GA, and had a lack of relief operators, but it
was pretty good propagation wise. Our club didn't really make that much
contacts...(570 something, with 270 being mine)...80/75 phone was good
for east coast...(I got sick of Ohio heheh)...and 6 land was good on
20 meter thru the night...(we didn't operate any CW)...40 was nationwide
around 5-9am EDT... all in all, we worked every section on the sheet
except for AK, ID, NV, SD, AB, and NWT (does anyone work NWT?)....

It was a lot of fun...

73 de John, n4tii
(who got stuck operating for 13 straight hours because of a crappy ham
club that does not like to be involved!)

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
---

This article will tell you how to find the answers to frequently-asked Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on the 7th of each month. This article is posted on the 14th, 21st, and 28th of every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP and from e-mail servers. This article contains instructions for obtaining a copy of the FAQ. It also contains the table of contents from the FAQ so that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good signal-to-noise ratio in the newsgroup. However, they can't do it alone - you, the reader, have to use them. If you are a new user, please print and review the FAQ articles and look at the instructions in the news.newusers newsgroup before posting any articles. If you are an experienced user, please help by refraining from answering frequently-asked questions on the newsgroup if they are already answered by the FAQ articles. Instead, send e-mail to the user who asked the question. (It will be helpful if you include the part of the FAQ that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ---

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews

If you are familiar enough with NetNews to look through previous articles on your system, Option #1 above may be the easiest for you. The FAQ is posted so that it should not expire from your site's news spool until the next one is posted. Unfortunately, some news administrators do not honor the expiration dates meant to preserve the FAQ.

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, updated daily when changes occur
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, updated monthly
rtfm.mit.edu pub/usenet/news.answers/ham-radio-faq/part*
located in eastern USA, updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, updated monthly (mirror of Buffalo)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

p00361@psilink.com (Wayne Cronin) writes:
> I operated Field Day in class 1D (home station, commercial power) from
> here in Tempe, Arizona.

I was at a 3-club Field Day station in Loma Prieta, CA in the Santa Cruz Mountains about 15 minutes from San Jose. (Yes, that was ground zero of the '89 quake.) The club call in use was K6FB. (2A Santa Clara Valley)

To my surprise, the novice station ended up using my call, KD6EUI. We couldn't find any genuine Novices anywhere so a few of us TechPluses began to ask each other if anyone wanted to use their callsign on the station. No one jumped to it. But even before we were done, an Advanced who heard this sat down at the station and started using my call since it was the easiest in the group to send in CW. And so, that's how my callsign ended up getting used on the club's novice station. :-) :-) :-)

I got a kick out of it... I recently upgraded from no-code so I made my first CW QSO there. But, since the station was using my callsign and people were using CW on it before I did, I guess it could be said that my license did CW QSOs before I did. :-) At least it was the same day.

My first CW QSO was fun. You only get one "first" and this will be a story to tell. I saved the paper where I copied: "KD6EUI DE K6RL QRS"... we laughed. That was my first CW QSO - they weren't supposed to tell *me* to slow down! Probably was another first on the other end... :-) I had fun. (Can't you tell?)

> (From what I heard on "Spectrum" on WWCR Saturday night, it was bad
> everywhere!)

On 10m SSB, we worked Florida and Hawaii several times each from the novice station. The propagation came and went a lot. I remember we had two good openings to Hawaii on Saturday afternoon. We turned the beam toward them to get the most of it while it lasted. You had to chase your opportunities but they were there.

10 & 15 were dead overnight. We changed to a G5RV and used 40/80 CW.

Of course, while all this was going on, the clubs' main stations were racking up 30-40 CW and 10-15 SSB QSOs per hour, except in some of the wee hours of the morning. They got Argentina at some point there. (I don't have the

logs.)

Oh yeah... propagation was pretty good on the OSCARs... ;-) when there was one around. We had a small crowd (including me) observing the OSCAR 20 and 21 passes late Saturday night. We all laughed when our club's first contact on Oscar 21 was a 2A San Francisco station (only 90 miles away! :-)

The satellite and packet stations did fewer contacts than the novice station. Now that I've been at a FD site big enough to have all of these, I understand why novice/packet/satellite don't count against the number of transmitters. They're really only for show or fun - you can't make any serious numbers of points with them. :-)

>Kenwood (at least) had electronically variable IF selectivity in
>an Amateur Radio product earlier (no later than the TS-830).

What I meant was that Drake was the first to combine a form of IF shift with continously variable bandwidth adjustment in an amateur radio. The two together are better from an operating perspective than either alone. I'm amazed to hear you say that the TS-830 pre-dated the Drake equipment. My 1A receiver was circa 1961. I thought the TS-830 was a late 70s design that post-dated even the R4C.

BTW, *I* think the misnomer is to call IF shift passband tuning. Tuning connotes a pitch change to me, while shifting the filter center does not.

Yeah, that's interesting. (Thanks Al.) I note with interest
that PVC is worse than dirt at the higher frequencies and
that rubber and wood, and that our old friends Bakelite and

epoxy are worse than PVC. Maybe we should make our PC boards
out of dirt. Then we could really say our projects are cheap
as dirt. :-)

>We should all keep in mind that a *broken* insulator is
>often worse than a lossy one. While a fraction of a dB

Yes, there's often a tradeoff between reliability and performance
in many things, from car engines to microwave preamps.

>Given the electrical/mechanical tradeoffs, PVC is probably the
>best choice, followed by wood (which is even worse electrically!),

>nonconductive booms) often requires changing the element lengths as well.
>Aluminum antennas tend to be a lighter and more rugged, due to the
>better mechanical properties of the material.

While limitations on tools and skills are an issue, I think one of
the reasons that PVC and wood are commonly used is that they are
easily available at the corner home improvement store while aircraft
aluminum tubing is usually a special order item. I'm a nuclear certified
welder and have a shop full of metalworking equipment, including heli-arc
equipment, but I still use materials such as wood and PVC for non-critical
projects because I can buy them over the counter on the spur of the
moment. Of course I don't expect them to last forever, PVC embrittles
under UV bombardment, and wood rots. If I were installing something
in an inaccessable location, I'd use different materials. I originally
used PVC schedule 80 pipe for the cross boom of my satellite array,
but changed to the electrically worse fiberglass because of embrittlement
problems.

Sometimes, such as the gamma rod spacers, there's no substitute for
an insulator (quarterwave metal stubs are impractical because the spacing
of the rod is important). I could have used glass, but that's rather
fragile for a tower that's climbed frequently. PVC was "good enough".
"Better" is often the enemy of "good enough". A smart designer knows
how to trade off *all* the factors in his projects.

>what rigs will qualify in the same class. I need such info to choose a model
>as my first HF rig. I will a summarize the responces to this newsgroup.

While the above listed rigs are still good radios, technology and time
have marched on. Several of the listed rigs use tubes that are now
becoming harder for the average Novice to find at the corner drugstore.
(Remember tube testers at the local drugstore?)

I'd update the list to include more recent offerings, while noting that
some of the newer rigs are actually inferior in one way or the other to
those listed. The first generation of all solid state HF radios is suspect.
There were many problems with overload, crossmod, and short final life.

Any of the Icom 700 series would be included, though some, like the 745,
hold their programming in battery backed RAM and losing the battery means
a trip back to Icom to be reprogrammed. Of course the Kenwood 800 series
needs mentioning. The TS830 is still considered one of the finest HF radios
made, and the TS820 wasn't bad either. And TenTec has never made a
really bad radio (though watch out for those Molex connectors, they
corrode). In general, look for the previous generation of top of the
line radios for good deals, but start looking at solid state radios
due to the lack of new tube manufacture in the US. Even solid state
radios can become problems, however, due to the use of proprietary chips
or now obsolete transistors. In that regard, TenTec shines because they
tend to use popular off the shelf parts, and factory support of older
radios is excellent. A *late* serial number Drake TR7 could be a good
choice, but these still claim a premium price from some hams. Avoid
the early TR7s, they had lots of problems.

In new rigs, the hands down price/performance winner (IMHO) is the
Icom 735. A used 735 would be an excellent purchase. Used TS940s and
even used IC751s aren't bad deals either. Fortunately, there aren't
many dog HF radios on the market anymore. Unfortunately, the same

can't be said for VHF/UHF radios. There, sticking with older Icom gear, or new Alinco rigs is the way to go for base/mobile rigs. Avoid most Kenwood VHF/UHF offerings. THey are plagued with a host of problems, not the least of which is poor thermal design. There are a host of HT offerings and most are servicable. The Yaesu FT470 is a real standout, however, due to it's good user interface and good price/performance. Generally, the really tiny radios, and those with extremely wide receive coverage, should be avoided. They suffer too many operational problems from high intermod to short battery life to really bizarre user interfaces. Stick with proven rigs like the IC2AT, IC4AT, IC32AT, and the like in older handhelds. Some will point you to Motorola HT220s and GE Mastr HTs, but they have little or no frequency agility, nor do they have TT pads. You can drive nails with them though.

The usual method is to use a regular crystal controlled converter
with a 3.5 MHz LO crystal. That puts the VLF bands in the 80 meter
band, and gives some relief from image problems of the BC band.
You'll almost certainly want a selective preamp ahead of the converter.
This tends to be a bulky LC affair, but with the usual collection of
random long wires, and the large number of VLF noise sources, it's
almost mandatory.

A *standard* VU meter is a basic 30 ua movement, with a very specific
damping characteristic, in series, either internally or externally,
with a 3900 ohm resistor. Zero VU corresponds to 0.774596 volts across
a 600 ohm load. In the Heath world, or in consumer/amateur gear in general,
the word "standard" seems unknown. So just whore in any sensitive meter
that will fit the hole and use resistor networks in series/shunt to give
a pleasing reading.

Well I enjoyed Field Day. It was rather tiring for the gasping geezer
but it was fun.

I had the other than 40meter CW station at N4NC at Cary NC. We made
over 500QSOs. (The 40 meter CW station had near 1000.) I don't have
the numbers on the SSB stations but they were real busy.

Our best band was 80 meters through the night. Propagation was poor
on the upper bands. We had some QSOs on 15 and 17. I understand the
SSB guys made some on 10. We never got around to trying 10 I guess.

A guy with a huge signal (Henry 2K) was complaining about us cluttering
up the band. I told him our objective was to learn how to operate in
adverse conditions. He was one of the adversities.

We used CT for logging this year. A few didn't want to use it but we
managed to convince them to go along. It worked well.

Anyway part of it is getting a group to work together and just have fun
doing it. I think we accomplished that with out a doubt.

> dxing etc. and would appreciate any comment about the above one plus
> any suggestion other magazine especially 73.
Again sadly -- :-(-- the American education system has left most
people barely capable of reading beyond a "See Dick. See Jane." level,
and the magazaines your are already subscribing to, particularly QST,
are already criticised by many as being too technical already! Any
more and....who knows ;^)

> I'm currently subscribed to QST and CQ but neither fully satisfies my whishes
> regarding tech articles.
QEX, expensive though it might be, may be your best bet. Then again,
you are already subscribing to CQ, owner of the Ham Radio subscription
lists and presumably technical staff...though they remain well hidden! ;^)
And, QST does have some technical building projects...you may have to
settle for a Euro magazine to get what you seek...

To be honest, last year I was in Ontario and was NF3I/VE3, and did
a lot of QSO's on 20 meters.

This year, I operated from the woods behind my house in Maryland, and
ran in the 1A-battery class.

High band propagation STUNK!

10 and 15 meters were BAD (1 QSO on 15 and none on 10 - little heard)
20 meters was almost as bad! (6 QSO's)

It seems as though we're getting into the bad part of the sunspot cycle.

I managed 105 QSO's on 40 and 27 QSO's on 80. Very strange - almost
nothing was heard from beyond Ohio/Indiana/Ontario. Very little was
heard from the southeast US. Nearly everything was from:

WPA/EPA
WNY/ENY
CT
WMA/EMA
VT
NH
ONT
OH
VA

And a couple from GA, NC, and WV. And this includes a re-positioning
of the antenna, which was a sloper with the upper end at 75 feet.

Still, 119 contacts with 3.5 watts out from a few batteries was pretty
exciting (CW only).

The thunderstorms were a bummer, though. Off air for 6 hours due to
seemingly infinite amounts of lightning (and subsequent sleep...)

Landline BBS open to all: (916) 262-1657
RACESBUL.280 DATE: June 28, 1993
SUBJECT: OPS- Are YOU trained or untrained?

People sometimes get "fed up" with the idea of training.
"Who needs it", is the phrase I hear from time to time from those
outside of RACES. Well, we all benefit from it, but perhaps we
need to paint a clearer picture of why, and its benefits.
In a comment by David Fowler regarding Fire Service
response, the following appeared:
"I always want to know how a system is going to work under
operator stress. My experience shows me that people work best
under stress with those things they are most familiar with, and
will reject new procedures, systems, etc., that are introduced
during a stress period. Training is one way of making the
unfamiliar familiar."
Let's repeat his last statement: Training is one way of
making the unfamiliar familiar!
It reminds me of an incident message a few year back that
involved a person whose name was long and difficult to spell.
Let's say it was "Jwailicowski" for illustration and no offense
intended. Mr. J, lets call him, was an agency official, but
a responding volunteer didn't know him nor had he heard the name
before because he never really participated and attended
training. During an emergency a two minute message came in. This
particular volunteer spent four minutes getting the phonetic
spelling on the one word name when he should have taken ten
seconds. Had he belonged to the organization and attended its
training --- which included familiarity with personnel --- he
would have been familiar with Mr. J's name and could have simply
written it out correctly after only hearing the name once.
Instead, because of his lack of participation and training, he
tied up the net for an excruciating four minutes that drove
others to distraction.
Small potatoes? Well, maybe, but small potatoes grow into
big plants that send out runners and shoots into many areas. So
it is with lack of familiarization (training) of people,

procedures and systems. Attend ANY opportunity for
familiarization and orientation; you will never know what you
missed if you don't attend!!

So, I'm not the only ham who has experienced GFI RFI. My GFI's were cured by connecting a 0.01 uF 2 KV capacitor from each side of the incoming line to the ground terminal, right on the back of the GFI. Radio Shack has such capacitors, but be sure to get the 2 KV rating. Do not use 1 KV capacitors. I'm not sure how the capacitors could be installed in a circuit breaker type GFI, but it seems to work on the outlet type.

>the TS-830 pre-dated the Drake equipment. My 1A receiver was
>circa 1961. I thought the TS-830 was a late 70s design that
>post-dated even the R4C.

Thanks for correcting me that Drake got passband tuning -- they call it *sideband tuning* -- into a radio before the 2 line. But the 1-A cannot continuously vary its bandwidth; its SIDEBAND TUNING control does not vary the width of the window, which is specified 2.5 kc wide at -6 dB and 8.1 kc wide at -60 dB. (The manual is right here with me as I type.)

None of Drake's amateur radios, at least those up through the 4 line,incorporated *continuously variable selectivity*. Not including the R-4C, Drake did selectivity adjustment by *step*-varying the coupling (and maybe, if necessary, tuning) of IF tuned circuits. The R-4C went to crystal filters circa at its circa-5.5-meg IF and did passband tuning by varying one oscillator that fed two mixers. That's electronic passband tuning.

But these radios did not allow continuous variation of IF selectivity, by "filter scissoring" or otherwise. I may be wrong about exactly which factory-made ham radio first included electronic (filter scissoring) bandwidth variation; I may even be wrong about which manufacturer first did it. But it wasn't Drake!

>BTW, *I* think the misnomer is to call IF shift
passband tuning. Tuning connotes a pitch change to me, while
shifting the filter center does not.

I won't try to change your opinion. Collins introduced the term and the implementation; I defer to that. From my standpoint, tuning varies recovered-audio pitches only in the special case of nonsynchronous heterodyne reception. :-)

>that cover, say, 6-meters to 220 mhz? Do toroids work that
>far up?

Toroids will work up to at least a few hundred MHz if you
keep the wire length down to a fraction of a wavelength.
You often see broadband couplers using tiny toroids and
very fine wire. Of course, this isn't too practical if
you are looking for low loss/high power handling capability.
The impedance is also a factor--the lower the impedance the
easier it often is to go higher in frequency, particularly
if you can easily make your windings transmission lines of
the right impedance for the desired transformation. You
might study transmission line transformers if you are
interested in why this isn't too practical for most
amateur VHF work.

BTW, I wondered why the good old 10 bifilar turns of #28
wire on an FT-37-43 worked so great as a 50 to 200 ohm
transformer. Turns out the winding was around 100 ohms,
about what you want for a wide bandwidth transmission line
transformer. I asked Wes and it *wasn't* intentionally
designed to be a transmission line transformer.

From: JMG@tntech.EDU
Message-ID: <01GZWPEVGCW29JD4CS@tntech.edu>
Source record: 279850

Hi,

A good while back I pulled some info about the ZS6BKV antenna from somewhere. I built one for Field Day.

This is a 5 band tunerless antenna which was developed using computer modeling. It has a good SWR on 40, 20, 17, 12, and part of 10 meteres. Mine also was resonant at the lower end of 80 and worked fine on 15 meters.

It is 92 feet 2 inches of wire (split in half as a dipole) with 40 ft of 450 ohm ladder-line as a matching section. This is then directly connected to some 50 ohm coax.. I used RG58/U. I then took about 5 extra feet of coax and tightly looped it around the end of the coax section nearest the 259 connector to keep out RF.

The club used a 440 with an autotuner and a bunch of QRP kits I had built. The antenna was up at about 25 feet to start, then I restrung it to about 40 feet.

The 440 easily tuned the antenna on all except 160 meters (no big surprise here). The antenna worked GREAT. After I restrung it at the 40 foot height.. seemed to be able to work everyone first try with the 100 watts and had real good success with the QRP rigs.

The antenna seemed to outperform the G5RVs that were strung around at the other tents.. and has the advantage of working a number of bands without a tuner

From: JMG@tntech.EDU
Message-ID: <01GZWPFEUJX49JD4CS@tntech.edu>
Source record: 279851

I received and built my 2 Kent Key kits.

The first one I buildt was the Twin Paddle Morse Key kit. It has a real heavy steel base. The main parts are machined from brass bar. It has ball race bearing, solid silver contacts and fine pitch screw threads with instrument knuled heads that allow precision and individual adjustement on each of the two contacts and springs.

The kit comes with the main pars assembled. It was fun to put together.. and very easy. I suggest reading each sentence of the instructions a few times before acting on it. The directions are kinda backwards in my opininion.. EX: it will tell you to mount a part with a certain size screw.. after you have put on the necessary washer and solder lug.. instead of telling you to put on the solder lug, washer and then mounting the part.. no big deal.. still easy to put together.

Really pretty key... the plastic paddles can be mounted either with the pointed parts up or down.. I tried it both ways and mounted them up.. fits the way I send perfectly.

The paddles work GREAT.. you can adjust them down to "breath on them" level of sensitivity. I sold my Benchers immediately after using them. They can't fly apart like Benchers.. the arms are solid.

Next I put together the Solid Brass Morse Key kit.. a BIG straight key.. Had fun putting it together. This key is tied with the nicest feeling straight keys I have ever used.. still also like my Merrick solid brass from Canada. The Kent has all brass parts on a nicely finished piece of wood that has weights that go inside it.

The Kent is really nicely weighted...precision adjustable.. haven't had time to try every possible adjustment yet.. but easily got it to the point of loving the feel. Has a big knob with the flat underpiece..I am experimenting with a different approach to sending with it...I think it is like the old telegraph style.

A great key.. only thing I don't like is they should have used a harder wood.. the wood can be indented with any pressure.. not good for really using it environment.

I feel both keys were bargains.. don't remember exactly the prices (sent them in with the order). I think the paddles were around $65 and the straight key around $75 or visa versa.

Tony...during our operation at a temporary site, we probably heard well over a thousand stations on 80 through 10 meters. Most of these stations were portable or mobile (classes A, B, or C), and were running 150 watts or less with temporary antennas. Some people think it is a contest, but it is really not a contest at all because if you "win", you do not win anything (there are no awards). Field Day is nothing much more than an exercise and a majority of the active radio amateurs in the country choose to participate to some degree. It is one of amateur radio's traditions and if it were not fun, no one would do it. One of the objectives of Field Day is to test your communications skills under less than ideal conditions. This means (more or less) setting up a temporary station at a site of your choosing and then trying to make contacts with other similar stations. Most of us can tell you that it is not easy. If you do not believe me, try making any QSOs on 20 meters SSB with 100 watts and a dipole. Some brave folks even try QRP - now that is a challenge. Yes, there were a few "Sunday Drivers" on from their home stations handing out a few points, but these stations were in the minority.

>
>But no, the ARRL decides to make it a contest thereby cluttering up the
>HF bands. I had never heard so many rude and inconsiderate people than
>on Field Day.
>
If you look at the Field Day announcement on pages 123 and 124 of the May, 1993 QST, you will note that the ARRL mentions "eligibity to compete", but in the following paragraph mentions "emphasis on operating in an adverse environment (read heavy QRM) and learning how communicate in an emergency situation". Also, note that the 30 meter band is not to be used for field day operation. I also heard some rude and inconsiderate people, and some of them were NOT participating in Field Day.

Also note in the announcement that nowhere is it mentioned that there will be any awards.

>Here's what KD1HZ and I agreed on. Why doesn't the ARRL set aside the
>bottom 10kc of each sub-band (gen/adv/extra) for normal QSO's and the
>rest can be the contest garbage. That way hams like myself who really
>don't like the contests can have a place to carry on normal QSO's. But
>then, you'd get those hams with Henry 3KW amps and beams.... and we all
>know where THEY are. :)

The ARRL went even further than that; they set aside an _ENTIRE BAND_ (30 meters) for anyone who wanted to to escape the FD QRM. There should have been no FD activity there. I also heard a lot of wide open space on 10 meters below 28.300 and above 28.500 MHz, and 10 was open most of the weekend. Even 17 meters was not all that busy. So anyone who really wanted to could have found some room to do some casual operating. I have observed that most people would just rather complain. That takes less effort, doesn't it?

I last upgraded to Extra in 1986. I've been out of the licensing scene for awhile. My wife now seems interested and, with all the changes in the last five years, I'm not sure what's required. She probably wants to get the no-code technician. What's the current novice and tech materials that she should study? I hear the novice is being changed in July. I obviously want the new material.

Specific publications would be appreciated. (Can you get them at Radio Shack? Not much else around here in Utah that I know of.)

I participated in the Bellevue (NE) Amateur Radio Club's Field day this year and had a great time. I do not have my license yet, but I worked at the novice/VHF/UHF shack. I made some real good 2m contacts using my HTX-202 and a homemade 1/4 wave ground plane antenna (Bellevue to Bennington Ne was my best) on only 3 watts. My XYL came out at about 8pm and we got her working the 2m ssb and then the 10m rigs. Her first contact on 10m was with Wyoming, followed by North Dakota and then Oregon. Made a couple of the old hands look bad who never got Wyoming or ND before. Anyway, she had a great time as well. Anyway, that is my impressions of Field Day this year.

> So, how about it folks? How did it go in other parts of the country?
> (From what I heard on "Spectrum" on WWCR Saturday night, it was bad
> everywhere!)

I was part of the club station VE7BAR (3A, B.C.) and had a ball on 15m.
Propagation changed from minute to minute, but we got as far as KH6, KP4,
and P4 (had to look that one up...), and on 15m alone got about 25
states and most provinces. This was running barefoot (100W) into a sloper.
We had CW on 40, phone on 20, and the local VHF guru was muttering rude
things about 2m propagation.

|
|>2.Do FM broadcasters (in the broadcast band) usually use vertical polarization?
|> Would this imply that if I use a dipole antenna that I should string it up
|> and down instead of horizontally?
|
|The broadcast standard is horizontal polarization, but the practice at
|the vast majority of stations is to run circular polarization. This allows
|good reception by horizontal home antennas and by vertical auto antennas.
|Vertically polarized antennas will usually be plagued by multipath to a
|larger degree than horizontal antennas due to the tendency for most radio
|reflectors in the environment to be vertical structures.
|
|Gary

Hmm, I have heard of circular polarization, but now I begin to think, "How
do they do that? Spin the broadcasting antenna? ;^)"

But then I suppose they could acheive the same result as spinning if they
simply had two stationary antennas, one horizontal and one vertical, and
by varying the amount of power sent to each according to a sine function.

A newcomer going for their no-code technician would have to pass the Novice
and Technician written exams. I used the Gordon West no-code technician
study guide which I bought at Radio Shack for under $10. Yes, the question
pool changes as of July 1 so be sure to get the new one - it should have
the effective date on the cover. I don't know when the new one will be
available. Be aware that Radio Shack is clearing the old one out at $4.95
or so and your wife would likely pass the test using that guide as long as
she really understood the subject matter and did not just memorize the
answers. I wish her good luck, I wish I could get my wife interested - it
would make buying new equipment easier ;-)

4298. Need Help with KDK FM-2033 Transceiver

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-28 17:57:10 UTC
From: kristin@gandalf.UMCS.Maine.EDU
Message-ID: <1993Jun28.175710.17247@gandalf.UMCS.Maine.EDU>
Source record: 279862

A friend of mine is having problems with a KDK FM-2033 transceiver.

She has taken it to a competent electronics repair person and
was given the following description of the problem when
it couldn't be repaired. Does anyone have any idea what might
be the problem? Has anyone had a similar problem?

From turn-on, the unit will fire up and will transmit
with the function switch in the M-Ch position, and if the
function switch is then put in the VFO position, it will
also transmit. However, if THEN placed back in the M-Ch
position, the unit will not transmit unless one switches back to
VFO and to M-Ch again.

The repair person verified it is not a dirty switch or broken wire.

Thanks

Kristin

This year decided to try something different... for my first solo Field Day.

Set up on the 18th Street beach at Ocean City NJ and used a kite to support
a half-wave vertical for 20 meters. Ran <5 watts of battery powered (1B)
20 meter CW with an Oak Hills Research "QRP Spirit". It was great!!

Worked 42 stations in 3 1/2 hours on the beach Saturday afternoon. Later
in the evening I set up the station (again) on the porch of the house where
I was staying (1/2 block from the beach). Used the same half-wave wire
strung between the porch posts about 8 feet off the ground and made a few
more contacts!

Made a total of 53 contacts in 24 sections with less than 5 hours total
on air time.

4302. looking at HF rigs?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-28 18:54:46 UTC
From: jeff@vicorp.com
Message-ID: <1993Jun28.185446.19984@vicorp.com>
Source record: 279869

I just passed my tests to get my Tech+ ticket. Now I'm looking to
get an HF rig. I'm very interested in HF packet, and I would like some info
on what to look for in a rig. Right now I am looking at the Icom 728 or the
Yeasu 747. I am more impressed by the specs on the Icom, but the Yeasu claims
to have a 100% duty cycle. I've read in some piece of literature that for HF
packet a good duty cycle is needed, so is 100% duty cycle nessicary? Also are
most HF digital modes on SSB or would an FM option be a good investment, what
about that AFSK? Any other info along these lines would be helpful.

So anybody running HF digital modes let me know what you think and/or
let me know what rig you use. Thanks alot.

Message-ID: <1993Jun28.194957.23339@worldbank.org>
Source record: 279872

Not wanting to open a can of worms... but, I'd be curious to know people's feelings on soliciting FD QSO's over the local packet cluster (and perhaps more importantly, making the QSO using the cluster).

Over the weekend, I received many unsolicited requests for FD contacts on the local packet cluster. Consequently, a lot of terminal beeping was actually Announcements and Talk commands directed at getting FD contacts, rather than DX put-outs. Fortunately, the "SET/FILTER/BAND=ALL W" probably eliminated most of the extraneous noise. I'd like to pose the questions:

- Is FD considered a contest?
- If the answer is Yes, would that not invalidate any contacts made using the cluster (where someone with 0.5 watts could connect to a local node and then get credit for contacts in 3 or 4 states)?
- If the answer to both is Yes, where does it stop? Using repeaters? Cellular telephones?

Don't get me wrong, I'm not anti-Field Day, just curious as to how it fits in with the DX Spotting clusters.

Does anyone have a list of all battery types and characteristics on-line? I know that some batteries need to be drained before recharging to avoid a build-up of "memory". Some need to be kept charged all the time. Some batteries drop output quickly when they die. Some drop gradually. A list of all battiers - rechargable and non-rechargable - with a quick run-down of their characteristics would be a nice thing to have in the archives. If anyone has any list like this, I'd appreciate a copy. Or, if you can reference any magazine articles for me that covers this stuff I can get it and type in all the relevant information. Thanks.

Devon

The FD rules specifically state that for packet contacts one can use nodes
or digipeaters. I think the amount of contest traffic on packet is so low
that the added advantage isn't that significant.

: Don't get me wrong, I'm not anti-Field Day, just curious as to how it fits in
: with the DX Spotting clusters.
My only question would be, "How do the owners/users of the cluster feel about
it?" I made a few packet contacts, some direct, some via nodes, but I didn't
even think about using a DX cluster. I think the people who run and use the
cluster would be annoyed, as that's not what it is there for. The nodes are
intended for people to extend their range of contact to talk to others.

Just my $.02 worth.

4311. Opinions wanted: ICOM IC-3230H

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-28 21:02:55 UTC
From: srtest@netcom.com
Message-ID: <srtestC9Cnsw.Gux@netcom.com>
Source record: 279778

Anyone have experience with the ICOM 3230H dual band mobile rig? I'd like to hear your comments, flames, modifications, etc.

I have an IC-229H, and am considering the trade-offs of adding 440: get an IC-449A, or an IC-3230H. I am quite satified with the 229.

The ICOM glossy mentions remote control features on the 3230. What are these? Are the receiver decks separate (to minimize intermod)? Is there any way to add more memories?

Finally, how does the 3230 compare to other dual-banders?

All comments appreciated!

We have a similar problem here only we're trying to run the Buckmaster
on a Unix box. We found out that the International calls are encrypted
as well as station location info. So, my question is if anyone knows the
encryption method, I'd like to hear about it since Buckmaster is being
totally obnoxious when we inquire about the possibility of (GASP!)
source-code so we can get it to run on a Unix Box. Grrrrrr... :(

Yes, of course you can work the same people on different bands for points in FD. Those "15A" clubs have people working different bands and modes at the same time, and if you work W1XYZ on 20 CW, you are not expected to drop everything and run around to all the other 14 stations telling them not to work W1XYZ again.

If in doubt, read the rules in QST - you get answers much quicker that way than by asking on the net!

My wife, who isn't a ham, went to field day with me. She was operating on 40m and I was logging for her. This was her first time EVER talking on a ham radio. She looked at me, pointed at the radio and said "I want one of those." Needless to say I was grinning from ear to ear. Last night she finally cracked to cover of Now You're Talking. I sure hope she is really interested, and stays interested.

I worked 20m for 2 hrs on Saturday (as VE3 RAM) and logged 50 QSOs. I was on
the second shift, and the operators in front of us logged at least 100...
There was about 20 min where we couldn't get out aroun 17:00-1720 EDT, but
other than that it was no problem.

100W SSB was the mode of operation. Most of the QSOs went to Alabama, FLorida,
Georgia, and the Carolinas. Picked up some in Arizona as well.

Yes, the two components must remain 90 degrees apart to achieve
circular polarization. That's done simply with an electrical quarterwave
phasing line.

: point itself; how the wire hangs) make very large changes in the antenna's
: effectiveness. Apparently, my first positioning was just right. Now, of
: course, things have moved and I can't find the "sweet spot" again.

Yes. The J-pole will induce feedline radiation unless the feedline
comes out at a right angle (wildly impractical, right?).

I solved the problem by coiling the coax into three 2" diameter loops
just below the bottom of the J (assuming you have a mast). Then, tune
for lowest SWR.

As a test, check the SWR while running your hand along 1/2 wavelength of
the coax shield. If the SWR varies, you still have shield current. Try
placing the coil a little further down.

John-

I notice that every time someone cross-posts to other newsgroups, and misspells one of them, a "new group" gets created. Sometimes a more creative alternate name is made up, with the same results.

Such a group usually only contains one message. However, when replies are posted to one of the legitimate groups, they sometimes get cross-posted to the misspelled group. A popular topic can create quite an active bogus newsgroup!

>> Is FD considered a contest?

No, it's an emergency preparedness exercise, it says here.

>> Don't get me wrong, I'm not anti-Field Day, just curious as to how it
>> fits in with the DX Spotting clusters.

I also got lots of requests for QSOs via the DX spotting cluster,
it didn't bother me that much. If we all get blew up by nucular
boms, I'll use the DX cluster if that is the only way of contacting
someone in Arkansas. It won't be, of course, and we won't have a
year's notice of the event, as we do for Field Day.

Field Day is perhaps archaic, but they say it's good fun. Using
the DX clusters seems in keeping with the general spirit, and in
any case much of the DX was covered up by FD activities, so you
weren't missing much.

4329. Kenwood 440 filtering

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 00:42:13 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9306281742.aa29146@Paris.ics.uci.edu>
Source record: 279793

Curious: Anyone out there replace the stock Kenwood filters with the International Radio replacements? The IRCI catalog makes glowing claims, and I am really interested in anyone's practical experience with these filters. I have the 1.8 and 0.5 Kwd filters in my 440, and they are OK, but having used a Ten Tec Argosy II this weekend for FD (on CW), I found the filters in there so pleasant....and I suspect there may be a real difference here.

On the same note, if anyone has (or knows of) any IRCI filters for Kenwood out there floating around, I might be interested.

Well, "school" is not quite the right word -- "research group" is correct.
When you fire a respectably powerful laser pulse at one of those reflectors
through a good telescope, the return pulse averages *one photon*. Detecting
this is not an amateur project.

QST in teh July issue has an article on building 2m antennas that include
using PVC. In one the actual wires are inside the PVC. Wouldn't the antenna
be poor if if PVC absorbed signal? Since these were both meant for HTs I would
assume PVC doesn't absorb signal.

I was operating at W7BI in Issaquah, WA we were 2A WWA. It was first time at FD and on the air and making a contact and everything else you can think of.

Anyway, we worked Fl, PA, WPA, WV, CT, NY, TX, Russia on SAT, HW off the back of our 345 foot V at about 30-40 feet off the ground. I was REALLY impressed with the set-up. Heck, I was just imprssed!!

You are both right, really. In the US, a "school" can mean a university as well as a "kiddie school". One of the groups that did the early lunar laser stuff was here at U. Texas, so "university research group" would be correct. And yes, even with a 2.7m diameter telescope firing the pulses and collecting the returns, a couple of photons is a typical count.

It's pretty important stuff, but it was not appreciated by the astronomers sharing the telescope. The laser guys would only take over if the "seeing" (atmospheric stability) was good, and at least one astronomer used to put the telescope out of focus whenever the laser crew wanted to check the size of the images. Very naughty (and it wasn't me - those of us who observe faint objects do it close to new moon, which is not a good time for firing laser beams at the moon).

I forget now why this is in rec.radio.amateur.misc. -

I just got my Tech No-Code in June and I studied the RS book Now You're Talking. It was easy to read and I liked the extra stuff that it had in it. It talks about all the different areas of HAM rdaio although of course briefly. It gives tips on just about anything. I thought it was great for a newbie like myself who wanted to know a lot about amateur radio.

The staion I was at had a packet setup and he was saying that they had to be simplex connection, not on PBBSes. But, later I noticed he uploaded something for extra points. I may have gotten it wrong, but I think thats what he did.

4336. Model numbers and Band (how do you know?)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 02:25:31 UTC
From: i7994779@wsuaix.csc.wsu.edu
Message-ID: <1993Jun29.022531.8038@serval.net.wsu.edu>
Source record: 279808

I have noticed that many times on the net and in magazine ads that often a radio is talked about and the bands it operates on is never mentioned. Is there some way of knowing by the model number or do you people just know every model number and manufacturer there is? (Ok no Genius wannabes reply to that one!)

```
Archive-name: radio/ham-radio/hams-on-usenet/part1
Last-modified: $Date: 93/06/28 20 04$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
First part contains primarily European calls with US call districts 0 and 1.
The index of parts:
Part 1 contains 4x1pi through k1zz
Part 2 contains n2aam through kc4zwi
Part 3 contains kj5aa through n7zzd
Part 4 contains wv8a through zl4rae

Ciao, 73 de VE6MGS/Mark -sk-

# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update May 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
```

Entries have this format (-> denotes separated by at least one tab):
Address (Name) -> Call -> Date
#
Address
Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

4338. Radio Amateurs on USENET List Jun 1993 Part 2 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 03:14:43 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1993Jun28.2@ve6mgs.ampr.org>
Source record: 279811
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part2
Last-modified: $Date: 93/06/28 20 12$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Second part contains primarily US call districts 2, 3 and 4.

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok)
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update June 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
```

the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

4339. Radio Amateurs on USENET List Jun 1993 Part 3 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 03:19:56 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1993Jun28.3@ve6mgs.ampr.org>
Source record: 279812
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part3
Last-modified: $Date: 93/06/28 20 18$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Third part contains primarily US call districts 5, 6 and 7.

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok)
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update June 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
```

the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

4340. Radio Amateurs on USENET List Jun 1993 Part 4 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 03:25:04 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1993Jun28.4@ve6mgs.ampr.org>
Source record: 279813
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part4
Last-modified: $Date: 93/06/28 20 22$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Fourth part contains whatever is left over ... US call districts 8, 9,
Canadian, and spots left here and there over the globe

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by

# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update June 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
```

Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

OK, I'll recant! I was just parotting something that I'd read in
a magazine or book article long long ago ... It may well be that
PVC has since been vindicated.

4343. APT-Sats: Report JUNE 26, 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 07:13:25 UTC
From: peter.henne@gmd.de
Message-ID: <1993Jun29.071325.3970@gmd.de>
Source record: 279815

Observed at station 50.7 NLat, 7.1 ELon, JUNE 26, 1993

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
Meteor 3-3: APT 137.85 On
Meteor 3-4: APT 137.30 *OFF*

NOAA-9 has drifted to later morning. This nearly 10 year
old spacecraft continues to transmit images of increasing
quality due to better illumination of its descending passes.
Meteor 3-5 was APT-inactive during all visible periods.
Meteor 3-3 suffers from malfunction of its exposure-control,
resulting in stripes of brightness-variations in the image.

(I regret the inconvenience if this was posted
before - our mailer was down)

4345. Correction: How to find the answers to FAQs about Ham Radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 09:37:55 UTC
From: ikluft@uts.amdahl.com
Message-ID: <5dSb03OLd5FM00@amdahl.uts.amdahl.com>
Source record: 279821

I made a correction to the mail-server section but not the corresponding one
in the FTP section... Please note the correction below.

My FAQ-posting program wrote:
```
-------------------------------------------------------------------------------
>How to find the Rec.radio.amateur.misc Frequently Asked Questions list
>-----------------------------------------------------------------------------
>[...]
>Option #2: Anonymous FTP
>------------------------
>[...]
>rtfm.mit.edu pub/usenet/news.answers/ham-radio-faq/part*
> located in eastern USA, updated monthly
> contains news.answers archive - most UseNet FAQs are here
-------------------------------------------------------------------------------
```

The Ham Radio FAQs have been relocated within the archive on rtfm.mit.edu.
All of the ham radio topics have moved under the "radio/ham-radio" directory.

The path under the mail server section is correct. The path shown above
should read:

```
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
```

4346. Whats a 115NO5?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 10:03:49 UTC
From: P.Lucas@mail.nerc-swindon.ac.UK
Message-ID: <9306291003.AA23142@swmis>
Source record: 279820

I am rebuilding a mid-sixties-vintage commercial RTTY demodulator [made by ITT-CREED]. It is tube-based, but some slimeball got at it before I did, and stole all the tubes. I have replaced most of them [they are almost all dual triodes wired as multivibrators and mono/bistables], but theres one tube which I am totally unable to identify. The chassis is labelled '115NO5', the schematic shows it as being some kind of relay (it has a coil, wired across the 115V supply, and a pair of normally-open contacts that apply power to the B+ line).
I suspect the 115NO5 is actually a thermal delay switch, but who made it? What is the delay time? (I can make up a solid-state replacement to get the equipment working if I know the necessary delay).

-Pete Lucas G6WBJ pjml%swmis.nsw.ac.uk@nsfnet-relay.ac.uk [Internet]
pjml@uk.ac.nsw.swmis [JANET]
Voice and digital modes, 50MHz and up.....

That's probably a unique feature of the news configuration at your site.
Undoubtedly some others will do the same. But more often, news admins set up
their sites to throw bad articles in the "junk" newsgroup.

What John was talking about was the new set of official newsgroups:
rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.space

I've been reading these groups and am happy to say that they are doing their
job. For example, rec.radio.amateur.antenna is already the *best* place to
talk/ask about antennas. And that's all they talk about there. The same
pretty much goes for the others as well.

BTW, rec.radio.amateur.digital.misc replaces rec.radio.amateur.packet, which
will be rmgroup'ed by the net.gods in September.

I said before we did ok on 15, reading the mail here (literally |^)) I guess we did real well. AA1DI and I working as a team logged 473 qso's on 15 m, we had one 2 hr pile up and according to CT, our peak rate was 126 qso's for the last 10 and 88 for the preceeding 100 qso's. What a blast! I never even noticed the bugs but have been scratching bites ever since! I know the club did well on 10, 20, and 40 as well using the call N1FCC, next year I'll suggest we use the call N1CQ who is also in the club.

Since I wrote the article Jeff refers to (HI Jeff!), I'll
take this opportunity to head-off the "where-is" posts by
re-posting my multiband wire antenna article again. Enjoy!
--cut here--
Multiband Wire Antennas
By Ed Humphries - N5RCK
Hewlett-Packard NARC Atlanta GA
edh@hpuerca.atl.hp.com

The March 1991 issue of CQ Amateur Radio contains yet another
discussion of multiband wire antennas. In his column "Radio
FUNdamentals", Bill Orr, W6SAI writes about the original W9CXX
multibander with its' complex copper tubing matching section.
He then goes on to discuss the popular G5RV developed by
Varney, which is widely built and commercially available. Orr
points out the deficiencies of the G5RV: when built in the
original design it delivers reasonable SWR on the 7, 14, and
24 MHz bands, but into a 75 ohm coax feedline that is awkward
to load up on modern transceivers; when built with 50 ohm coax
the SWR is poor on all bands, but it performs reasonably well
when used with a "transmatch" antenna tuner.

The column skips over an intermediate antenna design discussed
in the March 1986 issue of Ham Radio. Bill's column back then
pointed out that W5ANB first proved you could successfully
modify the G5RV, load it with 50 ohm coax and run without any
antenna tuner. But the best design (so far HI) he discusses in
both articles is the one by ZS6BKV. Brian Austin used computer
modeling to help him design a 5 band tuner-less antenna. Orr's
CQ column reprints the design using only the dimensions for a
300 ohm matching section (I presume TV flat lead qualifies).
In his original column Orr also presented the figures for using
400 (handmade open-wire leads) or 450 ohm (ladder-line) as the
matching section. Since 450 ohm ladder-line is somewhat stronger
than the commonly available 300 ohm TV lead-in, I'm here giving
both sets of figures so you can make your own choice.

```
< 90' 3" for 450 ohm matching section or 92' 2" for 300 ohm >
o-----------------------------oo-----------------------------o
||
The ZS6BKV Antenna ||
||
|| 40' for 450 ohm
||
|| 36' 9" for 300 ohm
```

||
||

At the end of the matching section Orr recommends a 1:1 balun; others would say that several loops of coax at the feedpoint will do as well to help keep rf off the feedline. The feedline to the transceiver is common 50 ohm coax; RG 58/U is fine for hf for most runs. This antenna should give low SWR on 7, 14, 18, and 24 MHz bands. At 28 MHz the SWR is really only good from 28.5 to 29.0. Tests showed the best SWR curves when the antenna was erected at about 42 feet above ground. When run as an inverted-V (90 degree) the resonant frequency came down 80 kHz for 14 MHz and 125 kHz for 24 and 28 MHz. The March '86 article printed SWR curves, and the March '91 article printed field patterns for all 5 covered bands.

4351. Re: QST Review for KWM-2.

In rec.radio.amateur.misc, ehare@arrl.org (Ed Hare - KA1CV) writes:
>In rec.radio.amateur.misc, mohan@tulip (Mohan Pakkurti) writes:
>
>>Can someone tell me which issue of QST carried a review of the Collins KWM-2
>>series of transceivers.
>
>>From the files of the ARRL Automated Mail Server, (info@arrl.org):

considerable text, consisting mainly of a download of our Product
Review listings [that doesn't include the KWM-2], deleted

This list is not all-inclusive. True, we apparently didn't review
either the KWM-2 or KWM-2A, but we did review, for instance, at
least one of the 32S transmitters and at least one of the 75S
receivers -- "separates" siblings of the KWM-2/A. I can say,
however, because I eye-scanned the *QST* indexes for the period
1958-1968 -- almost certainly that we actually didn't review the
KWM-2/A. (Items sometimes fail to make the December index.) We
also reviewed, for instance, the KWM-1 when it came out in the
late 1950s.

The Product Review list Ed Hare uploaded is not all-inclusive; we
only went back so far in entering the data because we chose to
limit the job to a period we decided would be of most interest
versus the cost of gathering the data. For a *QST* article of
potential interest for those interested in picking up where our
Product Review list leaves off, see "An Index of *QST* Items on
Commercial Gear" by Bill Wageman, W0BUR, and Carol Wageman,
W0HQH, in April 1968 *QST*, pages 56-59. Note, however, that this
article is not all-inclusive, either; it omits, for instance, the
QST KWM-1 review (Apr 1958, pp 23-27)!

Rather than curse their omissions, I prefer to applaud all such
tabulations as good-faith efforts to cast light into darkness.
Historical research -- and even looking up something as
high-visibility as a single review of a major piece of ham
equipment can be thought of as the first step in the 10,000-li
journey of being interested in history and doing something about
it -- is like radio direction finding: Bearings get you close,
experience with bearings gets you closer, but you finally
(usually) have to go the rest of the way on foot. In this case,
considering what I said up there about items sometimes not making
the December index, "on foot" might mean actually looking at each
issue's product review column, or at least each issue's table of
contents.

Finally, a note on *Product Review* contents. Before we called it Product Review ("ProdRev" is our in-house shorthand), we called it Recent Equipment. Its precise name aside, don't expect too much from earlier columns in the way of buying-decision help (as in "yes, but how well does it *work*?"). It hasn't been so long since we started buying our own gear "blind," testing it, and printing the results along with subjective comment about how the gear in question actually works on the air. For most of its history, the column consisted of little more than a photo or two, a review of specs, a look at a block diagram, and maybe circuit highlights, *for gear lent to us by manufacturers.* Nowadays, we expect that you expect us to help you make buying decisions, and the current Product Review process, from buying the gear we test to the words you read in *QST*, reflects this.

4352. Whats a 115N05?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 13:11:26 UTC
From: taylor@tix.timeplex.COM
Message-ID: <9306291311.AA02113@tix.timeplex.com>
Source record: 279826

The relay is 115 volt, 5 seconds delay and made by Amperite. The
heater (coil) is across pins 1 - 6 of the 9 pin min. tube socket.
The relay normally open contacts are rated at 115 v.a.c., 2 amp.
The contacts are pins 8 or 9 which make to pins 3 or 4.
If the unit handles a.c. across the contacts in your application,
make sure that any substitute can handle the load current and
voltage. A simple NE555 timer won't do it without some extra
components. In the Newark Electronics catalog the 115N05 is $ 75.00.
Amperite also makes a solid state replacement (115N05B) that sells for
$ 13.75. The only draw back is that the later is not directly plug
replaceable, but must be hard wired into the circuit.

I am interested in obtaining information, comments and technical/operating
manuals for a 2m synthesizer.
The company WAS:
VHF Engineering
320 Water Street
Binghamton, NY 13902

The model I have is called the "Synthesizer II." The PC board shows a date of 1976 and a number "0210." The rotary switches on the front panel are prefixed with "14", the first three switches are variable from 0 - 9 and the fourth place selects 0 or 5.
A tag on the bottom id's the +12 VDC, TX and RX lines.

I have the model operating and suppling signal. However, it would be nice to know how to adjust and properly care for this hardware.

Thanks in advance for any help or advice.

That's true, but my argument still holds. Cable systems can greatly increase the number of viewers both 'capable' of viewing a broadcase, and of those 'actually' viewing the broadcast.

> are *prohibited by law* from carrying. That includes most any uncut movie
> made in the last 20 years. They can also carry many many more choices
> than a broadcaster can because each cable channel can have a smaller
> audience and still draw enough aggregate viewers for the cable system
> to be profitable.

This is also correct, however I don't think it's relevant to the argument. This is going to happen, no matter if the broadcaster's signal is carried on the cable system or not. In fact the broadcaster has a 'better' chance of competing if his signal also appears on the cable system, than if it does not.

> Now that's good for the viewer, but it's bad for

> cable charge that they extract from the viewers. That's wrong.

Then the broadcasters want to be paid twice. First by the Advertisers, then by the cable operator, for the same material. I might buy your arguments if you could make me believe that the broadcasters would decline to count cable viewers as a part of the viewing audience in the rate calculation for advertisers.

PVC, and most other dielectric materials, absorbs RF, but it's not like
they are Faraday shields or anything. If you ran a kW to the antenna,
the PVC might get hot, but at the power levels this antenna was designed
for, no problem. The absorption we've been talking about is in the range
of 1% or less.

Recently I have had the pleasure of helping newcomers study for and get their licenses. The experience is great! Really enjoy seeing the bright eyes and hearing the cheering when they past the test!

After the joy wears off, and they wait, and wait some more for the offical ticket to come in the mail, these new hams begin to look for rigs.

We have been around to the local hamfests. There are some good deals to be found, if the new hams have enough working capital. Most of the people I have helped are operating on a shoestring budget to start this hobby.

s 1W - 5W enough power for these beginners to make a solid QSO?
Or should I steer them to higher power, older rigs like the Drake "twins" or a HW/SB-101?

As a final point, these students have learned electronic basics building projects at the bench. They show a real interest in the hobby, and we encourage them to learn. THey have also had some time doing SWL and sending off report letters for QSL's.

>>for his material, even though they are profiting from it via the basic
>>cable charge that they extract from the viewers. That's wrong.

This negates the fact that the cable operators, in the past, had no choice about carying the broadcast signals. They were forced to carry these signals by the FCC, regardless. Even if a particular broadcaster had few viewers, the cable system was required to devote hardware to carry the signal. The profitability of such could be questionable.

>
> There is at least one other perspective. It is that of respecting others'
> intellectual property rights and paying them for using their products.
> Not paying broadcasters after selling their material affects consumers
> too. It reduces the revenue to broadcasters and hence their willingness
> to produce new, and probably expensive, programming. Enforcing intellectual
> (very loosely speaking, of course) property rights fosters innovation and
> creativity.

I commented in an earlier followup, in regards to the broadcasters wanting their cake, and eating it too. They appear to want to be paid 'twice', first by the advertisers, then by the Cable operators, for the same material.

I might buy the argument, if the broadcasters would decline to count cable viewers, in the rate calculations for advertisers.

Anyway, I think the FCC came up with a quite fair solution. The Broadcasters have a choice to continue to have the Cable operator 'forced' to carry their signal (and broaden their potential audience), or to give the Cable operator the choice, and negotiate a price. Thus the broadcaster is put in the position of 'truly' having to compete (it's a free market, right ? and some like WGN, WTBS and others, do it quite well) with the cable program providers, or having the choice to continue to take a 'free ride' on the cable system, without having to compete with quality programming. I think it's a good thing. If the broadcaster is going to be paid directy, then the cable operator should have the choice to carry or not to carry, just as he has with any other programming he 'buys'.

>supply, DC or AC, from about 8 to 18 volts or so. The other one the original
>poster described is the HD-10 (I think; I used to have one of those, too).

Sorry Jay, it's not the Micromatic. The HD-1410 is a
solid-state keyer reviewed in the Mar 78 QST on p 38. It's 3
X 5 X 7.4 inches with two black paddles and two black knobs
on the front panel.

The Micromatic is the SA-5010, reviewed in May 82 QST on p
41. It is easily recognized by the membrane keypad and the
silver touch paddles.

>
>The touch paddles are the Micromatic's most controversial feature: folks

stuff deleted

I own a Micromatic, and I'm of the "hate those touch
paddles" persuasion. After opening the keyer (no easy task)
repeatedly to clean the paddle-to-circuit-board contacts, I
permanently stowed the paddles in their little tray and
bought some Bencher paddles--much better.
Even so, I dislike Heath's use of a 3-pin header as the
paddle connector. Granted, it probably saved them $0.25, but
it's weak and the connector is not polarized. I eventually
soldered a cable and a 1/4-inch stereo jack to the header.
Now it's easy to move the paddles to other rigs with
built-in keyers.
I found the keyer most useful in its practice modes
while I was studying for code examinations. In use, I've
found the membrane keypad and touch paddles user unfriendly.

BTW--The HD-10 (Jan 67 QST, p 45) has a long, narrow
case with 2 knobs on top and white paddles on the front end.
All of these keyers use transistors--no tubes.

If you're looking for a good expensive keyer, I recommend the CMOS Super Keyer II (93 ARRL Handbook, pp 29-6 through 11). Kits are available from Idiom Press, Box 583 Deerfield, IL 60015, for $45 + $3 shipping. I'm not connected to Idiom Press, but I've built their kit and installed it permanently in my HW-9. The board is about 1.5 X 2.5 inches with the battery, 4 push-button switches and a pot mounted off board. The push buttons control the memories and some commands. Sending speed may be changed via the pot, memory commands or the paddles. The keyer has numerous commands that are input via the paddles and may be included in memory messages. A very versatile keyer for little $$. (The SA-5010 was $99 new.)

>>PVC does not absorb RF in the microwave region. Maybe your PVC is
>>different - give it the microwave oven test.
>>

PURE PVC is suitably low-loss. But quite a lot of the PVC tube sold for plumbing purposes has been 'loaded' (bulked out) with other materials such as carbon or talc. These can induce losses. I once tried to use a fiberglass tube as a coil-former, unfortunately it had been made with loaded resin, and worked better as a dummy-load than as a resonating component :-(:-(
The microwave-oven test is a good discriminator.

>feet or so, Kenwood xcvr).

I second that motion. We had 7 log pages filled up before midnight
on 20 cw. 40 cw was also very good. 15 cw was passable but we
didn't spend much time there as the other bands were so hot. Also
worked a lot of 80 cw during the wee hours. I don't know how our
phone station fared as I spent most of my time on cw. All in all, I
though it was one of the better field days in a couple of years.

The above was done with inverted V dipoles at 40 feet and 100
watts of power (TS-450S) running from a 12V battery. We ran 2A with
one phone station, one cw station, a novice/technician station, packet,
and vhf/uhf.

I talk at a lot of amateur radio clubs. So I get a good idea
of what they are all about. It seems there are two topics at ham
clubs:

1. What we are going to do on field day.

2. What we did on field day.

Seems that item one is club business until the end of June
then item two takes over until December.

But to be fair, sometimes to relieve monotony they do
sometimes discuss the other subject:

What's wrong with the club repeater and when are we going to
fix it.

Sound like your local club?

I'd stear them to older commercially produced stuff. The Heathkits things like the 101 are only of marginal design when built properly, and I've seen some pretty disgusting things in used Heathkits I've owned over the years. Good bargins can be had on older Kenwoods and TenTecs (my mobile rig is a very nice TenTec Triton 3 that I got for $200 from another person on the net). For about twice that you can start to find the synthesized transceivers starting to appear on the used market.

One of the best deals to be had is to find the guy who always must have the latest rig, and arrange to buy his old rigs. Nearly always they are top condition, two year old radios at a decent price. When he switches again, you can unload the rig you got from him the last time for almost exactly what you bought it for. I exploited this for several iterations on 2M equipment.

4364. Why my SCOM 5K repeater controller crashed

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 15:16:38 UTC
From: millar@mervax.sanders.lockheed.com
Message-ID: <millar.35.0@mervax.sanders.lockheed.com>
Source record: 279736

Several days ago I asked for help in diagnosing my repeater's SCOM 5K controller. It generated "? RES" CW (indicating an internal reset) and also keyed the repeater transmitter at about 2 Hz with very brief pulses.

Thanks for the mailed replies from all of you.

The problem came from the power supply going into current limiting just at the time the repeater transmitter keyed up. On a scope, we saw the 13.8 VDC sag to about 8V for several milliseconds.

Apparently the ASTRON power supply goes into foldback if presented with current transients near the current limit (10 Amps from a 12 Amp ASTRON). But, the ASTRON holds fine at the sustained 10 Amps. So, when the repeater transmitter keys up, the ASTRON generates a low going transient down to about 8V.

Sometimes the transient caused the controller to cleanly reset and sometimes it caused the controller to crash and fall into that mysterious transmitting of short pulses. I still find it amazing that once crashed, the controller could find a way to recover itself. Usually, the recovery triggered off transitions on the squelch line from the repeater receiver.

The views expressed here are my own, not my employer's.

Nearly all of these microradios have terrible speaker audio.
The problem is after you put the display and the keypad on
something that small you get room for a speaker about the size
of a nickle. It's just not going to work. I have a FT470 with
the same problem. A small speaker in the earphone jack shows that
it's got plenty of audio power, just a better transducer is needed.

My favorite accessory is the Yaesu MH-19AB mike/earphone. It is a
small clip on mike that you place on your collar, it has a push to
talk button on the side and then the cord continues up to an earplug.
The mike is pretty good, you can leave it on your collar and just
push the button. I've even used it with good reports on a bicycle.
Of course, you end up looking like a member of the secret service
with the earphone and talking into your collar, but it's a small price
to pay... :-) I've tested the mike on a couple of different Yaesu's,
ICOM's, and Kenwood HT's and it's worked in each one (though oddly
the ICOM speaker mike won't key the FT470).

Yup, 20m was hot. Too hot for QRP phone to cut through the QRO traffic... we were running 4A, just under 5 watts and had little luck with either the dipole or the delta loop. When I checked out about 0600z, we had only made about 20 contacts on 20m. :-(

: transformer. Turns out the winding was around 100 ohms,
: about what you want for a wide bandwidth transmission line
: transformer. I asked Wes and it *wasn't* intentionally
: designed to be a transmission line transformer.

It also turns out that the impedance of bifilar wire depends upon how it is manufactured. Different wiresizes and dielectrics (insulation) give different results. Thus the best wire can often be selected for a particular use.

By using a combination of ferrite, appropriate line impedance and number of turns, it is possible to get baluns and transformers which operate from below 1 MHz to past 1 GHz. The effect of the ferrite "fades out" somewhere in the vhf region and the tranmission line and "air core" effects take over. This does take attention to detail though.

Check out the FAQ's that are posted here periodically.

Also, the archives at sumex (sumex-aim.stanford.edu) and umich (mac.archive.umich.edu) both have stuff available for anonymous ftp. Also AOL and Compuserve have stuff. And, there's an email server that mirrors sumex at rice (...!ricevm1.rice.edu!LISTSERV).

And, let me get in a little plug here. Check out SatTrak v1.02 at sumex (/info-mac/app/sat-trak-102.hqx) or umich (/mac/misc/astronomy/sattrak1.02.cpt.hqx). It's also at AOL, Compuserve, and rice. It tracks satellites, does grid squares, MUF, and other miscellaneous stuff.

If you're interested in SatTrak but can't download from the network, send a floppy (800K or 1.4M) and a prepaid mailer to the following address and I'll send you the program:

SatTrak

|> on Field Day.

On field day the bands are cluttered. During an actual emergency you might not get ideal band conditions. If you can learn how to pick through the noise and get the information the other station is sending, then you will be a MUCH better operator during an actual emergency when the pressure is on.

For emergency communications on the HF side, contesters are extremely effective. They train constantly by learning to pull out information from what most would call 100% noise. I want people who can do this on my emergency team.

Another thing FD teaches is what you forgot to bring, or didn'y anticipate needing. If you realized that you really should have brought a manual tuner or a spare power supply, and didn't, FD will tell you that. In a real emergency, knowing ahead of time may save lives.

|>
|> Here's what KD1HZ and I agreed on. Why doesn't the ARRL set aside the

|> then, you'd get those hams with Henry 3KW amps and beams.... and we all
|> know where THEY are. :)

Everyone would like everyone else's activities to be somewhere else. Some people don't like having people who want to carry on "normal" qsos QRM a user of the band who just happens to be calling CQ Contest on that person's favorite frequency, and has been running stations for hours.

The bands are there for everyone. Lots of people do like contests. We all have to learn to live with one another.

4370. Good Band for CW QRP Operation

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 16:42:00 UTC
From: hsdrpb@rcinet
Message-ID: <29JUN199311422691@rcinet>
Source record: 279741

Hello,

After about twelve years away from CW, and seven years away from
HF in general, I am thinking about getting into CW QRP operation.

I saw the QST review in the July 1993 issue, page 45 on the MFJ 9017
CW QRP transceiver. The article talks about the 18 MHz model.

My question is, Which band 40, 20, 18 MHz or 15 meters would be best?
My CW skils are poor at best. I just down loaded Super Morse from the
ARRL BBS to sharpen my CW skills. I would like to start on the Novice
bands. (my present class is General) But 40 meters has broadcasting
stations at night, and 15 meters is dead at night and in the summer.

Does anyone have any experience on 20 QRP or 18 MHZ?

Joe left before the real fun began. We could hear lots of stations, mostly 5's and 6's, but our 5 watts couldn't work many. Great signals from LA, ORG and PAC(Hawaii) among others. About 0630Z we let a DX junkie loose on the 20m phone station. This was a guy used to working a KW into a tribander at 105'. He started out calmly enough, but as more and more of those S9 stations ignored him the frustration level soared. By the time he gave up at 0715Z he must have been easy copy in the parking area 50 yards away through the forest. In his own words: "A megawatt mouth and a milliwatt rig, I can't stand it!"

It was interesting watching the way a DX'er works a station calling CQ. If the DX bug ever bites, I'll know some tricks to try. Screaming at the mike as loud as you can doesn't seem to help much though.

All in all, it was rather boring. We only made 6-8 contacts in a four hour shift. I expected more on my first Field Day.

Steve, et al.

.TAR files are not compressed, as posted earlier, they are merely archived. Usually the compressed files would have an extension in unix such as .tar.Z to indicate that they are ALSO compressed.

This format comes from early unix systems and was how files were traded between systems via tape. The compression only came LATER.

I'm partial to 20M. There's always lots of DX and stateside stations
on the air. During the last CQ Magazine DX contest, I worked about 20
countries in 4 hours of operation with an HW-9. You don't need an
elaborate antenna system...I find that an inverted-v up about 30 feet
works just fine.

40M is a good choice for QRP operation in the winter when static
levels are lower.

4376. Alinco DR-1200 and DJ-580 modifications

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 18:26:23 UTC
From: Bruce@Pixar.com
Message-ID: <1993Jun29.182623.6366@pixar.com>
Source record: 279753

I did the intermod-reducing modification on my Alinco DR-1200 a few days ago. It works very well - all of my intermod problems have disappeared.

The mod corrects an Alinco design mistake, in which they added clipping diodes to the input of the first IF amplifier, which has an internal limiter and doesn't need the clipping. A side effect was that the diodes mixed any strong signals in the passband, which caused lots of intermod. A microscopic surface-mount capacitor is removed to disconnect the diodes.

I also did the frequency-expansion mod, so that I could receive NOAA weather. The publishers of the mod neglect to mention that after you cut the yellow wire, you must reset the radio. Do this by holding <F> and <VFO/M> down while turning the radio off and on. Memory contents will be lost.

I have found that the microphone from my Radio Shack 10-meter rig works fine on the DR-1200, even the remote-control buttons work.

I'd like to know: Could they have made the same design mistake on the DJ-580? Are there any intermod-reducing mods for that radio? I've done the frequency mods. I have severe problems with intermod when using the DJ-580 for public-service work with other stations nearby. Of course, most HTs have horrible intermod, so perhaps the only solution is to work crossband.

Thanks

Hooray, Hooray, Hooray!!! It FINALLY came. I got my license in the mail yesterday. It only took 7 weeks and 2 days. I took my exam on May 8th and the mailperson graced me with a response from the FCC on June 28th. Not bad I guess. At least it appears to be an average waiting period. I'm not real sure exactly why it takes so long to turn these around. I mean it's not like they do a credit or a background check on everyone who applies. Maybe I just don't understand how difficult it is to figure out what the next call sign should be. Anyway now I can get on the air.

My new call sign is N8ZLK. Sounds kind of nice, but it looks like Area 8 is just about out of 1 X 3 call signs. Does anyone know what the next sequence will be when they run through the balance of the alphabet? Do they start assigning call signs out of the 2 X 3 pool?

Anyway, I'll be on the air soon & hope to talk to some of you. All I need now is a good rig. Any suggestions for a mobile/base 2M/70cm all mode dual bander would be appreciated.

I guess it's off to learn the "code" so I'll be able to try the HF bands too. (oohhh the pain; but you gotta do what you gotta do.)

73

Steve -- N8ZLK -- now I'm a newbie and no longer a wannabe --
It feels good.

As soon as some people realize that there is some kind of "operating event"
almost every weekend and learn how to deal with it the better off everyone
will be.

Take a few minutes each month to READ the "operating events" section of QST
and work around the PLANNED ACTIVITY for that weekend instead of just
complaining about it.

>

Hi,

I have just finished building at least one or 2 kits for each of the
20,30,40 meter bands and have spent a great deal of time on each. My 2 picks for QRP
are 20 and 40. If I had to have only one QRP rig.. it would be for 20.

I find that if I want to rag chew, I can go to the top end of the CW
band, if I want to try for DX, I go to the bottom end.

If you don't want to build, the MFJ is a good little rig, and well
worth the price.

Field Day was not a bummer for us. Propagation was much improved over last year.

I organized the Novice/Technician station for the Loveland Repeater Association (W0DZ) here in Colorado. We never heard anything on 6 meters, but did very nicely on 10 meter phone.

Last year our Novice/Technician station (N0RQV) made 85 contacts on 10 meter phone while the band was open.

This year our Novice/Technician station (N0RQV) made 672 contacts on 10 meter phone. The band was open from 12 noon until about 9:30PM MDT and again from 10:45AM to 12 noon MDT. We ran about 90 watts USB and we couldn't talk fast enough.

Our biggest propagation hole seemed to be to New England and down the Atlantic coast through Virginia. We got Alaska but not PAC (pacific).

[Author was Gene Wolford]
[Posted on 29 Jun 1993 12:55:29 -0700]

A friend has an old Swan tranceiver which uses TV sweep tubes for finals.
He uses 6MJ6's to replace the original 6LQ6's.
He wonders if anyone has done a conversion to 6146's?

Anyone know anything about this?

Thanks,
Gene

Make that *will* not get ideal band conditions. I spent the first five hours
after the Loma Prieta Quake on HF, and we had one heck of time, running
barefoot with big beams, trying to maintain a frequency. We had to compete
with a number of well meaning Bozos running KW amps. A number of times the
VHF op leaned over my shoulder to inquire how the heck I was able to pick
calls out of that mess.

Contesters and DXers, given a modicum of extra training, make the best HF
emergency ops.

This brings up an interesting (at least to me) thought. I would hope that during
a real emergency operators would be polite and set up some means of orderly
handling traffic. It's much the same with marine VHF. It's pure chaos until
there is an emergency and then "most" people cooperate. The present Field
Day exercise tests equipment but does nothing to teach etiquette for use in a
real emergency.

Hmmmm.... an Advanced class amateur was operating your Novice/Tech station?
Don't tell anyone at the ARRL. The Field Day rules require the Novice/Tech
station to be operated (and even set up) by Novices and Technicians only.

Subject: Ground Rods in tower base

In article <C8zqDH.3In@news.claremont.edu> aross@jarthur.claremont.edu
(Andrew M. Ross) writes:
>
>Putting ground rods through or into concrete is a Bad Thing. I've
heard
>stories about concrete slabs (usually tower bases) that exploded when
>lightning hit.

This is an old wives' tale Andrew. Any conductor sufficient to conduct
the surge current when in air or soil is even better when embedded in
concrete. Only in cases where there are *no* conductors embedded in
the concrete can the resistance to the surge be high enough to cause
heating that will "explode" the concrete. The one thing concrete is
not is a good insulator to lightning surges. As a general rule, you
should always use conductors in concrete tower bases, rebar will do,
as part of your ground system. See my posting about Ufer grounds for
details.

Well speaking from first hand experience I can tell you emphatically
not to put ground rods into the concrete base. It is one thing to have
steel rods in there for strength but still another to have a surface -
to rod - to concrete - to ground path. I had a huge pad on a 60' crankup
go to pieces when a hit occured. No one had told me different. Afterwards
I heard from a lot of area broadcast people etc a bit too late. Since that
time I have avoided doing this without fail!

Yesterday I had a direct lightning hit on my Hy-Gain 18HT 50' vertical. It
is mounted on three huge insulators set on pipes that go into a very big
concrete "block". It has survived 85 mph winds although the top of the spire
has a kink in it from when a tornado came over two years ago. The lightning
not only went across the insulators and into the copper wire I have tied to
the pipes above ground and over to six ground rods.....but it also followed
the antenna into the ham shack and wiped out a rather substantial amount of
equipmenet...jumped over to another AC path and went into some more of the
house and took out the home entertainment room.

The concussion effect of the lightning rolling through the wall of the house
on the RG-8 blew a rather substantial hole. A name brand lightning protector

cartridge blew to pieces and it continued it's travel uneffected.

It welded a Drake R-4C/MS-4 speaker together that were sitting side by side on a shelf. A Pyramid PS-35 power supply exploded internally and the seams where the cabinet/panels fit are now welded to where I had to cut into it with a metal blade on my reciprocating saw! That is just the start of the damage.

The braided 10 G copper wires making up the ground system are blobs of copper now. The tops of three of the six rods are burned/melted off. The ground shows considerable disturbance around the rods. Had they been in the cement pod I think the antenna would be draped across the house! Oh...the antenna is about 14' from the buried telephone line/entrance. Guess what happened there! It arced (char marks on the side of the house show the path) and instead of going into the house it went back down the line to the telephone pole and blew a distribution box. So much for buried cable.

The fortunate thing for me is that I had pulled two 6' racks of mil spec and maritime receivers off line and off antenna and was rewiring the switching on them. They of course escaped unscathed. A laptop I use on packet/pactor is spread all over the radio room...pieces imbedded in the sheet rock walls.

Well the moral of all this is: Don't trust any protection device except total disconnection of antenna and AC power to your equipment!!! Also have insurance
that covers computers! (I lost three others besides the laptop.) And don't run a ground rod through your antenna base. 73, Frank K0JPJ ex-W5PVX QRT

```
-- MONTHLY REVIEW OF SOLAR AND GEOPHYSICAL ACTIVITY --
Summary for May 1993

Report compiled by the
Solar Terrestrial Dispatch
P.O. Box 357
Stirling, Alberta
T0K 2E0, Canada

Data Provided In-Part Courtesy of the
Space Environment Services Center, NOAA
and the
NRC / Dominion Radio Astrophysical Observatory
Penticton, British Columbia, Canada

MONTHLY ACTIVITY SUMMARY FOR MAY 1993

We are now in month 81 of solar cycle 22 (as of May 1993). There
were 285 flares (optical and x-ray) in May. This is a drop of 14% over the
number of flares observed in April. There were no major flares observed
during the month, while five reached minor M-class levels.

A breakdown of the energetic events for the last four months follows
below.

_____________________________________________________________
| | MAY '93 | APR '93 | MAR '93 | FEB '93 |
| | --------|---------|---------|---------|
| Major | 0 | 1 | 4 | 2 |
| Minor M-class | 5 | 2 | 9 | 16 |
| Class C or smaller | 280 | 328 | 351 | 410 |
|--------------------|---------|---------|---------|---------|
| Total | 285 | 331 | 364 | 428 |
-------------------------------------------------------------

The monthly sunspot number for May was 79.1 as computed by the
SESC. The preliminary RI international sunspot number for May was 61.2
which results in a smoothed sunspot number of 76.5 for October 1992.

The monthly 10.7 cm solar radio flux for May was 112.4 which
results in a preliminary smoothed mean flux value of 130.5 for October
1992. The monthly mean solar flux adjusted to 1 AU was 114.9. The best
absolute value of the estimated 10.7 cm solar radio flux for the month was
103.4 (Series D).

The largest x-ray flare of May was a class M4.4/2B tenflare from
Region 7500 from N19W48 at 23:01 UT on 14 May. The flare was associated with
major Types II and IV spectral radio sweeps, although the Type II had a
```

relatively low estimated shock speed of only 600 km/sec. The tenflare measured 970 sfu and lasted 37 minutes. The x-ray signature of this event had an attractive long-decay signature typical of events capable of accellerating protons. Protons at greater than 10 MeV began arriving at 00:45 UT on 15 May and reached a maximum flux of approximately 3 to 4 pfu at 01:50 UT on 15 May. This region was rather small when it produced this flare (only 190 millionths) and had a DAI optical configuration. It was also in a state of gradual decay. It failed to produce any other M-class events before rotating out of view and dying behind the limb.

The list of minor M-class or greater flares and associated radio emissions observed during May follows:

SUMMARY OF MAJOR ENERGETIC EVENTS

Date Begin Max End Xray Op Region Locn 2695 MHz 8800 MHz 15.4 GHz

Uncorrellated: 52 1 0 2 0 0 0 0 112 (39.3)

The geomagnetic field in May was less active than in April. The estimated planetary A-index for May was 13, compared with 18 for April. This results in an estimated smooth value of 16.4 centered on October 1992. There were no sudden magnetic impulses observed at Boulder during May (unofficial).

The most disturbed day of the month was 10 May where the estimated planetary A-index was near 54 (major storm levels). Major to severe geomagnetic storming was reported from the middle and high latitude regions during this event. The source of the activity appeared to be a well-placed coronal hole. However, it may have been enhanced by an M-class flare-related CME that occurred on 07 May from Region 7500. This flare was associated with a Type IV sweep. This particular geomagnetic disturbance exhibited a strong recurrent tendency, extending back at least two solar rotations. Recent observations (Carrington Rotation 1870) seem to indicate that the same hole responsible for this disturbance has become an extension of the southern polar crown. It is expected to produce a similar enhancement in geomagnetic activity near the end of June or early July.

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in
September 1986. The sunspot maximum for this cycle (cycle 22) occurred in
July 1989, with a peak smoothed sunspot number (RI) of 158.1.

Note: Prior to June 1991, the 10.7 cm solar radio flux measurements
originated from the Algonquin Radio Observatory near Ottawa. From June 1991
onward, the flux has been (and will continue to be) measured from the
Dominion Radio Astrophysical Observatory at Penticton, British Columbia,
Canada.

But for now, you can just concentrate on code, since you have the
ticket and thus the theory. That's much less of a hurdle to
cross than doing both code and theory at the same time.

>Steve -- N8ZLK -- now I'm a newbie and no longer a wannabe --

Actually, as far as I'm concerned, you've been a newbie since passing
your test. You just had to wait for the FCC to send you your
official documentation.

4392. Field Day '93

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 20:58:46 UTC
From: saswel@unx.sas.COM
Message-ID: <199306291958.AA08844@cardamom.unx.sas.com>
Source record: 279757

Well I made it through my first Field Day!! What an experience!!

Our club, Raleigh Amateur Radio Society(RARS) operated as W4DW on
80m-70cm (CLASS 9A) and me and some fellow Novice and Technicians
operated the Novice/Tech Station under the call KD4WTJ.

To celebrate the 60th Anniversary of Field Day our club had
another group of folks under the call N4IQA working Field Day
with rigs from the 30s, 40s, 50s, 60s, and early 70s. They called
themselves the Jurassic Park of Amateur radio. They had some really
neat working old rigs!! They also had a mini museum of other rigs
from those time frames. It was really fascinating to see some working
history of amateur radio.

Here in NC, the band conditions didn't seem too bad...but, I don't
really have any other Field Day or Contest experiences to compare
it to.

Our Novice/Tech Station consisted of a Yaesu 747GX and two
inverted Vs. One was cut for 10 meters and the other was a
80-40-10 mulitibander that tuned up pretty good in the Novice
subbands.

On Saturday we operated 10m Phone mixed in with a few 15m, 40m, and
80m CW contacts. On Sunday we mainly worked 10m because of the much
improved conditions and the fact that we were getting tired and our
CW copying was marginal (My CW needs lots and lots of work!!!).

On Sunday morning around 1200Z things picked up on 10 meters with lots
of 4s, 5s, and 6s coming in strong. We were even able to work LU2NI and
we heard a couple of VP2??(Virgin Islands) stations as well as, another
Argentina station(LU1BR)!!

Overall I had a great time and my operating skills are much better
than when I started out on Saturday at 1800Z. A couple observations
from a first timer:
1) It seemed that most common courtesy rules that we observe
in day to day operations were ignored. We had at least 7-8
CW contacts wiped out by someone calling CQ FD on "my"
frequency without asking first to see if the frequency was
busy (We only had 10 or so total CW contacts and I
personally got frustrated and stopped trying to make
any more CW contacts).
2) It also seemed to me that the major focus of FD is the
contest and not the emergency preparedness function?
How does FD prepare us for emergency action? I guess it

also depends on the group of people you are working with!

All in all it was a great experience and I am ready to do it again!!

I tried this too. Made things worse :-(

: As a test, check the SWR while running your hand along 1/2 wavelength of
: the coax shield. If the SWR varies, you still have shield current. Try
: placing the coil a little further down.

Oooh, neat test. Thanks!

What I've currently done is to shorten the copper part of the J-pole *below*
the J back to where the original plans had it (about 34"). This seems to have
restored balance to the universe, and all is working more-or-less as it was.
There probably still is some feeline radiation (I'll try your test), but it's
not nearly the problem it seeme to have been before.

Now the question... Why does the length of the antenna below the J make a
difference? My own theory (please correct me) is that this part resonates
with the top part to make the antenna look more like a center-fed dipole
with a funny matching section. At 34", plus about 5" between the bottom of
the J and the feed point, it comes to about a 1/2 wavelength; one of those
magical numbers.

At least it sounds plausable...

|> horrible intermod, so perhaps the only solution is to work crossband.

--
It's possible. Apparently Alinco made a production change in the 580
sometime around March or April of this year which drastically reduces
intermod. Early 580 owners have complained of excessive intermod but
owners who have bought theirs since Dayton have commented that they
haven't experienced any intermod. Mine is apparently one of the newer
versions as I don't experience any intermod when in high RFI areas
even using my new 'high gain' ANLI 800 duckie. I do not experience
intermod in places which used to bother my Uniden BC200-XLT or my
PRO-43 handheld scanners...

4397. The one black spot on my Field Day (longish)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 21:40:15 UTC
From: dana@lando.la.locus.com
Message-ID: <1993Jun29.214015.153750@locus.com>
Source record: 279773

Two negative things happened during my Field Day, but only one really qualifies as a black spot.

One of our stations was being operated by a young ham with an older Extra class ham constantly hovering over him. This older operator is well known in the amateur world for writing articles aimed at helping beginners (I don't he's ever published in QST, though). This older guy had, up until this event, impressed me as a reasonable, even if opinionated, guy. So that I don't slander his good name, we'll refer to him as Mr. Elmer Hamster.

I wandered over to check out the station, and the young operator (14) was pursuing USB contacts on 10m. He was having trouble getting through to another station. I mentioned that some amateurs will say part of their call in order to establish a contact, for example, I might say 'Six Juliet' in an effort to establish contact through a pile-up.

Mr. Elmer Hamster suddenly lets loose with a string of expletives, claiming this practice was illegal since you are mis-identifying. He told me that he sent postcards to warn amateurs that they were in violation of the rules when he heard them do this. His sentences were something like "sh*t-sh*t-operating practice, god-d*mned-sh*t-operating don't teach that god-d*mned sh*t to this ham who is starting out".

I thought about it, and explained "You are required to identify with a complete call sign every ten minutes and at the completion of a QSO. I do not agree that using a partial call sign is illegal or improper".

Before I finished this sentence, Elmer Hamster was off on another string of expletives "Save that god-d*mned-sh*t for some kid who is naive" or something like that.

I was shocked. This guy, well respected for his writing for beginning hams, was using extremely offensive language and manner in front of a 14 year old boy. Furthermore, his point was moot and based entirely in personal opinion. At the time, I shook my head and said "I disagree, <Elmer Hamster>" and walked away.

I'm a little concerned. I'm tempted to call up the boy's parents and explain what happened, since I know I would not want my children (I have two) to associate with an adult who spoke that crudely and set a poor example of personal respect. At the same time, I'm also inclined to simply forget about it, and write him off of my list of people I care about, and probably warn adult hams not to let their children associate with him, other than possibly reading his column.

What would you do?

P.S. The other negative thing, only slightly negative, is that my father, ill with a seriously advanced case of cancer, passed on 7:30a Sunday morning. I'm glad his suffering is over, and may God rest his soul.

>73... Mark AA7TA

Actually there is a good bit of DXing on 30m. But it is not always the '599 tu' type. You often get a chance to TALK to the other person. For those who kinda new to the DXing thing, alot of 'common' (READ EUROPE) can found on 30m. Also alot of ZL and VK. ZL1AMO always includes 30m when DXpeditioning the Pacific islands (currently on 3d2r).

Maybe we should keep it a secret to avoid the crowds, eh? :-)/2

4399. Ham Comm 2.0 circuit

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 22:27:05 UTC
From: UD116446@NDSUVM1.BITNET
Message-ID: <93180.172705UD116446@NDSUVM1.BITNET>
Source record: 279767

A while ago I tried making the Ham Comm circuit. I hooked it up to a shortwave radio and couldn't get anything understandable to show up. I guess the program is supposed to decode RTTY and CW. Will it do either with a regular AM shortwave reciever? I also don't know what RTTY sounds like, so I can't be sure that it didn't work. If anyone has had any luck with this program please tell me what is wrong. Thanks!

In theory, a J pole is a quarter-wave matching section driving an end-fed half-wave.

I'll venture a guess that you're coupling feedline radiation back into the 34" section, which behaves like a quarter-wave. I've always used a short (nonresonant) pipe below the J for mounting purposes. As an experiment, maybe replace that lower pipe with a shorter (~10") section and see if the tuning is still squirrelly.

In the twinlead version of the j-pole, I use the coils with no protruding stub. It tunes OK and there is no feedline radiation, per the hand test.

4401. power supply for Alinco DR-1200T?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-29 23:55:03 UTC
From: xyzzy@panix.com
Message-ID: <20qkon$3bb@Panix.Com>
Source record: 279771
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

I just purchased the Alinco DR-1200T, my first radio bigger-than-a-handheld.
I'm going to need a power supply; but Ham Radio Outlet says their
"least expensive" would be $109.

Is that ridiculous? (a real question) What should I expect to pay?
Does anyone have a power supply that they would give/sell to me
for a lot less?

Inmarsat terminals. After all, the idea is to get the data through, not
to prove just how difficult communications can be made. :-)

4403. Questions about wire.

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 01:18:52 UTC
From: martinbw@jackatak.raider.net
Message-ID: <66NX6B1w165w@jackatak.raider.net>
Source record: 279655

I am trying to find some wire to power the radios and other equipment in my car. What I am looking for has 2 stranded conductors with a black and red insulation so that I only have to deal with one wire as I am installing it and I can tell which wire goes where (Red to + and black to - side of the battery) I am looking for this stuff in 12 gauge to handle 15 amps @ ~13.8 volts and in 8 gauge to handle 50 amps+ @~13.8 volts. I have looked all over Nashville, TN from Home Depot to Radio Shack to the little electronic Junk store called Javanco (realy a nice place to find odd little electronic stuff). I am looking for realativly small amounts of this stuff (20-30 ft.) but any help would be appreciated.

Also a technical question do the number of strands and the size of the strands in a wire affect the current and or voltage handling characteristics of a piece of wire. I am wondering if I can useheavy gauge speaker wire if I cannot find what I am looking for above. The monster cable type of speaker wire that I have seen has lots of very finestrands that make up the wire and I wonder about its current handling capability.

4404. Non-Resonant Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 01:29:01 UTC
From: Cecil_A_Moore@ccm.hf.INTel.COM
Message-ID: <930629172901_1@ccm.hf.intel.com>
Source record: 279772

```
> 92' 2" for 300 ohm
> o-----------------------------oo-----------------------------o
> ||
> The ZS6BKV Antenna ||
> 42 feet in the air || 36' 9" for 300 ohm
```

This information applies to anyone who is using coax to feed a non-resonant antenna system, like the above and the G5RV.

W5GYJ's ELNEC program plus the Smith Chart results in the following:

frequency antenna coax/twin-lead junction SWR at
impedence feedline impedence 50 ohms

7.2 MHz 355+j770 39+j6 1.2/1

14.2 MHz 82-j505 33-j123 ll+/1

18.14 MHz 382+j868 36-j48 3.1/1

On 20 meters, 100' of RG-58 WASTES MORE THAN HALF YOUR POWER, dissipated as heat, because of the 11+/1 SWR at the coax/twin-lead junction.

To double your radiated power on 20 meters, bring the 300 ohm ladder-line all the way to the shack to a balanced output antenna tuner.

David... over the past several months I have been sending to the net a list of ham radio software for the Mac. It is constantly being updated with new software and new releases of the older software. I am sending you this list from my other e-mail account. I hope that you'll find something there that will fill your needs.

Listed as well is some of the more popular ftp'able sites for this software. If anyone has anything to add to this list... PLEASE send it on. The next big project I'd like to do with this list is to publicize it's System 7 compatibility.

My suggestion is first if this was a Club sponsored event to
contact whoever is in charge of the club or event and let
them know what went on. This person has no business being
around young hams unless he gets his act together.

If nothing is done immediately, then contact the parents.

In rec.radio.amateur.misc, ryme@husky.bloomu.edu writes:
>[I]s 1W - 5W enough power for these beginners to make a solid QSO?
>Or should I steer them to higher power, older rigs like the
>Drake "twins" or a HW/SB-101?

This is a very tough question to answer, as it really depends on
the people involved. As someone noted in their FD report, some
people just get frustrated and quit. On the other hand, I dug up
my 1988 FD results. I made 51 CW contacts with under 80 mW and
another 11 SSB contacts with under 90 mW, while waiting for 6
meters to open up so I could finish up my 6 meter VUCC with 3 watts.

Highlights were a 30 mW 75 M SSB contact and meeting my goal of
60 < 100 mW contacts. I ended the contest by working a Novice/Tech
station. However, I note that I didn't work any 20M SSB, though
contacts were made on 9 band/modes combinations.

For merely hunting DX or operating contests, operating with low
power can be lots of fun. Sort of like fishing with lightweight
equipment. More challenge. But, if you want to run phone patches
for people stuck at Little America (KC4AAA), you probably want a
20 meter monobander at 100 ft and a legal limit amplifier. Last
I heard, they still don't have a satellite installation to make
phone calls--its either amateur radio or silence. The phone company
often gets their cut anyway--collect calls across the country weren't
unusual when N3KZ, the U of Penn club station had all that aluminum
in the early 80s.

Of course, there are times when running power is quite useful when
DXing and contesting. We were actually challenged once by K3CR in
the PA QSO party to be the top college club station, so
I interrupted by QRP contest work to run stations on 40 SSB just to
make sure we would win. I also guessed one night that VK0JS on
Heard island would go around calling big stations on 20 meter SSB
one night rather than twiddling their thumbs waiting for the band
to open.

My guess is that 1 to 5 watts would work just fine for most people
on 40 CW in the mornings or 10/6 meter SSB when the band is really
open. If you have to operate in the evenings, 20 CW is probably
the best choice, though 30M is probably better for chatting.
One hint is to ignore really loud stations that aren't talking
to anyone, or working one station out of a big pileup every five minutes.
It is often much easier to work weaker stations. Worst is probably
20 meter SSB, unless you count 40 M crossband SSB to work DX from
the USA. The problem with 20 meter SSB is that there just isn't

enough room for everyone when the band is wide open, so the weak stations get trampled. Sometimes, a not quite dead 10 meter band will yield surprising results with QRP. People tend to gravitate toward the strongest signal on the band. Your weak signal might stand out if the big stations are on other bands.

4411. AURORA WATCH: Middle Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 04:27:48 UTC
From: oler@rho.uleth.CA
Message-ID: <9306300427.AA13880@rho.uleth.ca>
Source record: 279628

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 04:00 UT, 30 JUNE

/\

NOTE: We are beginning to provide special satellite images of auroral activity over the Antarctic polar regions from the DMSP F11 satellite. Anonymously FTP to the site "xi.uleth.ca" (IP number 142.66.3.29) and grab the GIF-formatted images from the directory "pub/solar/Aurora/Images". We hope to provide at least one image per day while the terminator is away from the Antarctic region. These images are obtained from the low-light camera's on-board the F11 DMSP satellite. The camera mode combined with the fact that there is no moon is the cause for "noise" in the images. Convolution filters will eliminate this noise. Files have the format "DDDHHMMv.GIF" where DDD is replaced with the day number in the current year (001-365), and HHMM represents the hour and minute (in UTC time) of the observation. The "v" indicates that the image is a visible-light image.

VALID UNTIL: 19:00 UTC ON 03 JULY

MODERATE RISK PERIOD: 30 JUNE - 02 JULY (UT days)

PREDICTED ACTIVITY INDICES FOR NEXT 3 DAYS: 15, 27, 22 (30 JUN - 02 JUL)
(INPUT INTO THE PREDICTIVE AURORA SOFTWARE *)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

ESTIMATED OPTIMUM OBSERVING CONDITIONS: NEAR LOCAL MIDNIGHT

EXPECTED LUNAR INTERFERENCE: MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

MOST OF THE NORTHERN U.S. STATES AND SOUTHERN CANADA FROM SOUTHERN BRITISH COLUMBIA TO CENTRAL MONTANA TO NORTH DAKOTA TO MINNESOTA TO MICHIGAN TO NORTHERN NEW YORK STATE TO SOUTHERN MAINE AND POSSIBLY PARTS OF NEW HAMPSHIRE.

ACTIVITY MAY ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN U.K. TO THE NORTHERN EUROPEAN REGIONS INCLUDING MUCH OF
THE NORTHERN AND CENTRAL PARTS OF NORWAY, SWEDEN AND FINLAND, TO
NORTHERN RUSSIA. THERE IS AN OUTSIDE CHANCE AUSTRALIAN AND NEW
ZEALAND REGIONS MIGHT SPOT ACTIVITY.

* Contact: Oler@Rho.Uleth.CA or COler@Solar.Stanford.Edu for more information
regarding the Auroral Activity Prediction and Simulation Software.

SYNOPSIS...

A well-placed coronal hole will begin influencing levels of auroral
activity on 01 and 02 July. This recurrent disturbance has proven
geoeffective over the last two solar rotations and should enhance levels
of auroral activity to moderate levels. Activity is expected to peak on
01 July. Lunar phase will hamper attempts to view activity, but under
dark skies, many middle latitude regions should be able to spot periods
of activity on the horizon.

This WATCH will remain active until 19:00 UT on 03 July when it will
either be updated or allowed to expire.

** End of Watch **

```
================================================================================
========
The thing that I have found most useful is to increase your
wpm speed as soon as you start copying 50-60% of the text
correctly. And then occasionally slow it back down to give yourself
the satisfaction and encouragement of seeing your improvement.

Also I have found that when just learning the letters it was best just
to do short sessions at a sitting so that you would not get discouraged.
And once you have mastered the letters, numbers, and prosigns you can
start doing longer sessions (20-30 minutes).

And if this is not obvious...try not to teach Morse by sight, unless
all else has failed. When I was little I learned Morse code by sight
from the Radio Shack walkie talkie that I had, and it took me the
longest time not to do the translation in my head and just hear the
letters and words.

I hope this helps and please summarize the responses you get to the
net.

================================================================================
========

They put fifty of us in a classroom with a set of drill tapes. Each one
of us had a key. We had four days to get up to 10 WPM and if we didn't
we got transferred to the infantry and sent to Vietnam. This was very
effective.
--scott
--
"C'est un Nagra. C'est suisse, et tres, tres precis."

================================================================================
========

Hi...I am still stuck around 18 WPM or so, so I'm not really an 'expert'
in learning morse, but here's what I did. I went from zero to about 10
WPM
in trwo weeks by practicing with a computer playing files I got from
```

documentation of other programs. I would set the speed high enough so I
didn't get every character and thus improved. When I hit the brick wall
at 10 WPM I took a suggestion from a ham on the internet and PUT THE
PENCIL
DOWN. I started trying to copy only in my head, writing down only notes
like the call sign and name of the sender. This got me easily past the
13 WPM
requirement here in the US, but when I get nervous (as for a test) I still
write most every character down. Now that I am at the level of the W1AW
bulletins, I can't write that fast, so I must copy in my head and write
down
only the general drift of the message. I want to mention that actually
copying morse on the radio helped as much or more than using the computer
program. I'm not sure how to break through this latest barrier (18 WPM),
but I am using a mac program (Morse Trainer) and just started looking at
your program. I set the speed to 24+ WPM and am picking out characters
and som
some words, so I think I'm on the right track. I would very much like to
see
a trainer that allows "practice QSO's" with a computer. For example, I
could
send a CQ and the Cmputer would answer or it would CQ and I could answer.
I know some memory keyers and programs do this now.

Good Luck and thanks for writing for the MAC!

Tom
KJ5LT

==========
========

I used the following method:

0) Select a speed you know
1) plaintext (e.g. a usenet article) which uses all the
letters/numbers/punct.
2) random letter/number groups - five per group
3) speed = speed + 2; goto 1.

The Gordon West cassette tapes here in the US follow this method.

73!

Perry Scott
AA0ET

==========
========

I am sending you the file of suggested learning techniques, in the
hopes you might include some or all of it in your documentation. It is
NOT copywritten, and I would really appreciate some feedback on how

well the suggestions work for individuals. I try to modify and keep
the list of suggestions current, so feedback is important.

That said, here is the file:
--------------------------8><------------------------------
Some time ago, I wrote this short piece to help a new wannabe ham who
was having trouble learning the code, and have been adding to it and
modifying it ever since. I am passing it on to you in the hope that
you will find it useful.

Please help me out by giving me feedback and helping to make this document
even better for the next people who ask for help and receive it.

> About transitioning from dits and dahs to just associate sounds
> with characters.
> Does it come naturally, or is that something one has to actively
> work on to get it?
Well, there are many different ways of teaching Morse Code. And, there
as many different tools and aids offerred by well-meaning people as
there are people who want to help. The sad (and difficult) part is
that newcomers who want to learn the CW for an upgraded license must
somehow navigate these "tools" and find ones that work, often without
knowing enough about what they are trying to accomplish to make those
decisions wisely.

You have access to the InterNet, and hence I am assuming you are
computer-literate. I will further assume that somewhere you have
access to an MS/DOS machine... if so, ftp the file for SuperMorse,
version 3.16 from one of the sites and set it up, and try these
suggestions
for how to learn the Morse Code. When done this way, it really can be fun!

- After reading the documentation that comes with SuperMorse (about 60
pages of very well written information):

1) set the *character* speed to 23-25 words per minute.
This is way faster than you will be trying to copy at first, but if
you chose a slower speed, you will be handicapping yourself for the
balance of your hamming...learn the code ONCE, not again and again
as you gain speed...from your very sketchy comments, I gather you
have been trying to work the speed up slowly, and this means you
are actually trying to learn a different set of sounds as the speed
increases...which will slow your progress and become very
frustrating.

2) Set the word speed (time between characters) so that it is 1 or
2wpm *faster* than you can copy solid, and keep it always a little
faster than you can copy... This is how you drag yourself along
and improve your abilities.

3) Use graph paper to copy CW. The blocks on the paper are VERY useful
if you think of them in constructive ways: one of the beauties of
CW is that one can miss a character, or even 2, and still catch the

meaning of the message from context. When you copy and can not decipher a character, leave a blank "hole" on the graph paper -- you will probably easily fill it in later.

4) Learn to let go of any character you are unsure of. Avoid trying to be "perfect". You are a marvelous unreproducible unique human being. Perfect in the sense of your presence with a high power, perhaps, but *human* and fallible. Use that to your advantage! If you learn to let a character go when you do not recognize it, you will not likely miss the next one...if you focus on the one you missed, you will most likely miss several in a row, and that means a much larger "hole" in your copy, and greater difficulty in making a good copy. Use the graph paper to help by simply moving your pencil to the next hole, with perhaps an underline to show you are aware if having missed a character. Mostly, do not "punish" yourself for missing a character...celebrate the ones you DO get!

5) Make the text you copy fun. With SuperMorse you can make up things (read e-mail for instance!) that are somewhat familiar, and yet quite strange in Morse Code! Fun is the key. I send my students model QSOs with some of the fun people I have met in almost 40 years of hamming..and tell jokes and make the practice fun. That is VERY important...to have fun with CW.

6) Keep your individual practice sessions short...say TEN MINUTES at a time. Three ten minute sessions will do more good and make for more progress than one hour long session. Besides, ten minute sessions are pretty easy to work into the day...blocking out an hour is far more difficult -- and does NOT work as well! ;!)

7) Throw away ALL the visual aids. CW is aural not visual, and you must hear the characters as characters and words. The visual aids will only get you to about 5-9wpm and then will leave you stuck until you can overcome those bad habits and forget about using a mental "table-lookup" model.

8) Think of CW as distinct sounds. Each character has a unique sound. There are even WORDS that you will recognize very quickly -- "the" "name" "73" have very distinctive sounds for the entire word. My own copy speed is slightly above 20wpm...say about 25wpm... and yet I can hear "73" at the end of a QSO at 40wpm! Easily! It is just a complete pattern that I recognize as "best regards" without any of the inidivual character or character elements to slow me down. This is actually more easily done than said: at first, when learning Morse Code, the student wants to make rapid progress. That is quite normal and to be used to help. Unfortunately, the ways some people use to measure this rapid progress are counter-productive: they will do *anything* to learn additional characters, even if that hampers their copy ability with the characters they know; and, they will try breaking the characters into sound elements to make individual character recognition better (at VERY slow speeds). This technique ONLY works at very slow speeds and will hinder your

ability to progress to 13wpm or 20wpm... you will have to learn the code all over again at each new speed if you chose to break characters into distinct sound elements. Set the character speed at 23 or greater, and use the WORD speed to regulate how fast the overall code is sent.

9) Relax and make this enjoyable. Fable and myth make learning CW difficult enough without adding tension and regret to the list! ;!)

10) Most hams who passed a CW exam think it is necessary that everyone have as difficult a time as they did in learning, so they offer bad advice...not out of maliciousness, but out of ignorance. I teach CW and theory, and I really enjoy seeing my students go to exam sessions and blow the exams away!

I hope this will be helpful to you. Please PLEASE ask if you are confused or if you are having a problem. Everyone learns CW at a different rate, so avoid the natural human tendency to compare your progress with that of another ham. Go at your own pace, and have fun... and above all, Good Luck! I want to help, so please e-mail me if I can be of assistance.

==========
Lars-

For what it's worth, perhaps the best thing that could be added to a morse training program would be coded to add QRM/QRN and fade to the 'transmission'. In my experience, the people who have learned code by listening to the radio, with its attendant noise, copy much better. Those who have learned simply from a program with nice crisp and clear dits and dahs seem to be more easily distracted when copying. When I passed the 20 wpm test, being used to static and fades on the radio, the sound of the tape recorder was so clear it presented few problems, and I passed the first time (even though I don't think I'm a strong 20). Good luck with your program.

73,
Paul Hansen AA1GJ

While I agree that this ham's approach as you describe it was crude, rude and inconsiderate, I don't believe that it warrants much in the way of interaction with the young ham's parents. While we may not like it, I am sure that neither the language or the behaviour was new to the boy. At 14 and even younger that type of language is already widely used in the schools (regardless of how sheltered the school might be). One of the important things that we all must learn when growing up is what behaviour is acceptable in what circumstances in our personal interactions. Your Mr. Elmer is still so childish that he just hasn't learned that and I suspect that he never will. Given some of the stuff I have read on this group there are other like him also. Regardless I don't think that you need interact with the boy's parents. He will, I am certain, be developing his own approaches to dealing with situations like this. He has to grow up sometime and sheltering him won't work.

Also, you are absolutely right about the issue. As long as you identify every 10 minutes and at the end of transmission with full callsign, the FCC requirement is fulfilled.

Message-ID: <1993Jun30.131642.1@ntc01.tele.nokia.fi>
Source record: 279644

Hello and thanks for reading this. I am using a CUSHCRAFT R7 Vertical
and I am having "many" frustrating afternoons trying to tune it for
17 meters and especially on 30 meters. There is NO DIP in SWR on
30 meters ANYWHERE. I know the traps aren't bad because its "practically"
new. I have an SWR DIP on 17 meters but I would like the SWR lower.
On 17 its tuned at around 18.034 or so and I cant get it to tune to the
center of the band (I have tried everything). On 30 meters there is no
SWR point lower than a 3:1 everywhere. My guess is that it is tuned
"somewhere" below 10.000 MHZ I am starting to wonder if other people
have had this "problem". I have heard rumors but didnt beleive them.
I have it working fine on all the other bands but 17 and 30 are bands I
want to take advantage of. If you have any suggestions, please let
me know. I use an ICOM-751A and an amplifier COMMANDER HF-2500 into
the R7. (I only run about 400 Watts to be safe!) the R7 is mounted on
the ground in the "forest." Any sugges[Ctions are aprreciated! If you
hear me, be sure to give me a call!

From: wright_t@cho006.cho.ge.com
Message-ID: <1993Jun30.080726.757@cho006.cho.ge.com>
Source record: 279653

I have an Icom IC-229H. There are mods for extending the receiver coverage as well as extending the transmitter coverage. I have mod instructions from several sources and they all appear to be 'wrong' for my radio. All mod instructions call for cutting diode 'D5' and adding a jumper at 'land' point on the circuit board. I cannot find D5 or 'land' point. One of the mods has a top view of the radio circuit board pointing out the locations of D5 and 'land'. Also, it shows pots for adjusting transmitter output and deviation. My radio doesn't look anything like the diagram and I feel that the IC229 may have undergone a complete redesign. Does anyone have any info regarding this radio ?

Please post any replies here.

> I saw the QST review in the July 1993 issue, page 45 on the MFJ 9017
>CW QRP transceiver. The article talks about the 18 MHz model.

I have the MFJ9020 20M model. It works well, my only criticisms are that the "8 pole crystal filter" claim in the advert is bogus (it's a 4 pole filter) and there is no shaping on the keying waveform so I had to bodge in some capacitors. The Curtis keyer option works fine and the audio filter option is very worthwhile.

> Does anyone have any experience on 20 QRP or 18 MHZ?

I used the 9020 as G3XAQ/6Y5 while on holiday in Jamaica last December. The whole station weighed under 5Kg so I could take it as carry on baggage on the plane. Power came from an auto battery borrowed locally. An 8 section 28ft fibre glass fishing rod supporting an inverted vee dipole gave me responses to CQs at almost any time of the day or night. Although most of the contacts were with east coast USA, I got into western Europe and Australia on several occassions.

Rag chews at 599 over distances of several hundred miles were commonplace, so don't underestimate what 4W can achieve. There again, I had the advantages of steeply sloping ground down to the ocean and a 6Y5 callsign, both of which are worth several dB over the average home station, so your milage may differ.

Here are a couple of articles on Collins gear for those who are interested:

"Collins Owners' Reports: KWM-2 KWM-2A," _Ham Radio_, March 1981.

"Collins Owners' Reports: the S-Line," _Ham Radio_, April 1981.

Each report examines good features, poor features, problems, accessories, the "would you buy it again" question, and gives ratings charts in the following categories:

parts availability
accessories
price
flexibility
factory/dealer service
quality of workmanship
performance
maintenance
ease of operation
reliability
durability
instruction book

Send me e-mail if you want more information.

> Sound like your local club?

I'll bite! I was a member and then president of the Williamson County ARC (in central Texas) before moving to Georgia a few months ago. We had scheduled speakers every month with topics ranging from Getting that Elusive QSL (Thanks John Warren!) to Locating Interference Sources to Safety (HAZCOM, lightning protection, tower topics, etc.) to Building Your on QRP rig to Public Service Net Operations, etc. Oh, did I talk about Satellite Tracking and Ham Software Programs and Tours of area places of interest to hams? Or that we set up a neat once a year trade off with a sister club up the road where they came to our meeting one month and we went to theirs another? In short, I beleive we tried to keep a variety of topics going that covered things of general interest as well as giving introductions to some more narrow topics that might attract interest. WCARC is not a large organization, but I think the club did (and still does even without me I'm sure :-) a good job!

Of course we also had "business" topics. When the repeater amplifier broke, the appropriate committee reported what happen, what action was being taken, and what (if anything) was needed from other members. The field day committee recruited help as needed and ran _very_ nice FD activities the three years I was involved (missed them this year!). Our emergency coordinator kept us informed and involved in the weekly emergency net and in being volunteers in area public service activity. We had VE folks who recruited testers and testees and students and teachers, etc. We even had twice yearly picnics to coordinate and enjoy. Volunteers wrote the county emergency communications manual and spread the results as far as possible. The ARRL was good about material and information whenever requested. Swapfests were planned and attended with much enthusiasm. I could go on.

With the volume of talent and knowledge amoung amatuers, it seems to me that any club with the dull agenda listed by Julian (er, excuse me, Wayne Greene!) has officers who aren't even trying and members who are letting them get away with it!

4424. Re: Good Band for CW QRP Operation

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 13:09:10 UTC
From: dnewkirk@arrl.org
Message-ID: <1654@arrl.org>
Source record: 279639

My current favorite QRP band is 40 meters, for these reasons:

* there are plenty of people to talk to at any time of the day, including NovTechs, who you don't get to meet again (going up in freq, that is) until 15 meters

* the size of a useful antenna (half-wave dipole) is manageable

* the pattern of a useful antenna (*low* half-wave dipole -- that is, 40 feet and lower) is *optimal* for QRP: azimuthally, mainly omnidirectional, and elevationally, largely vertical -- that is, much of the transmitted energy goes up at high angles and therefore returns to earth within a few hundred miles, where a low-power signal will be entirely readable even to people without the patience/concentration to dig for weak signals

Arguably, the best period to get your feet wet in 40-meter QRP is during the daylight hours, when a low antenna's near-vertical-incidence energy meshes with the propagation prevalent on the band during the day. Many folks are on there just futzing around, conversing, CQing -- chummy, relaxed, no DX hyperism (mind you, DX hyperism has its place).

Possible results: Using a 1-watt-output transceiver (Roger Hayward's Ugly Weekender in June 1992 *QST*), I can't *not* have at least one contact per daytime operating period if I'm really in the market for a contact. People tell me I'm S8 or S9 when *they're* running *100 W*.

I slapped together a crystal oscillator using a 12EA6 -- one of those circa-1960 tubes meant for auto radios, with 12.6-V heater, plate and screen. Its output barely moved my power meter, and I had no means of measuring an output that low at home. I guessed that it was 25 milliwatts or so. Having only one crystal (not even the standard 7040-7045 QRP zone) and hearing no one on that spot, I called CQ and was immediately answered by a station just outside of Baltimore (if I remember right). A standard, enjoyable contact resulted. I worked one or two more folks in that operating stint, all on CQs. The W2 I worked along the Hudson said I was S8.

I measured the 12EA6's output when I got back to work after that weekend -- just under 9 milliwatts. So my contact with the Baltimore station equalled 38,000 miles per watt or so. (If you're interested in such numbers, fine. I don't live by them.)

Using a low dipole on 40 in the daytime, it's hard to emit too little RF to work *someone*. If just making QSOs and talking on CW is the goal, I simply can't consider running as much as 100 W; it ain't necessary. Currently, I'm fiddling with a 59 Tri-Tet; it puts out just over 2 watts. (One many possible next projects is a crystal oscillator using both sections of a 19 tube in push-pull. It was a *QST* project in the late 1940s: "The Last Ditcher.")

Nightime is a bit different: Skip is longer (and more noise skips in with it), so my signal is weaker relative to the noise on two counts. But I can still work someone almost every time I sit down at the radio. How could ham life be sweeter? :-)

I smile every time I remember the salesman trying to talk me out of buying my TS-130V (10 W); yes, power supply aside, I'd have gotten more watts for my money with a TS-130S (100 W). (The two radios differed in price by about $100, so obviously the salesman would have gotten something out of the bigger rig, too.) But my interests being what they are, the extra money and watts could not have bought me more fun.

Perfectly ok to run the twin lead back to a tuner. However, then the antenna is no longer a multi-band (tunerless) antenna. Built as designed and operated within the bands/ranges listed, the antenna works fine without a tuner. Tuners are fine, I've got my hf rig hooked to one right now myself, but there are trade-offs there too.

For Field Day, we built a full-sized 80M Zepp dipole fed with 300 ohn twin-lead, and ran the antenna as a sloper using Pitt's William Pitt Union as a 10 story-high antenna support.

This was my first experience with an antenna not fed via coax, and I was very impressed. We worked a ton of stations on 80 and 40, and my gut feeling is that this antenna outperformed the similarly-installed G5RV we operated last year. We even ran the twin-lead over a long metal railing to get to our operating position, and nothing bad seemed to happen. I'm now firmly convinced of the merits of twin-lead, and encourage hams who have been raised on the "coax only" school of antenna construction to give it a try.

My next experiment is to install a Zepp, attach the twin-lead to a 4:1 balun, and connect to balun to an automatic antenna tuner. I'm curious to see if this will make for an automatic no-full all-band antenna.

I live in central Mass. We have a local repeater on 147.315 (WB1EWS). There is a repeater in Prospect, CT (N1ADE) on the same frequancy that is at least a couple hundred miles away, yet can be heard daily, from S3 to S7 or so, in our area, and most other areas in central mass and northern NH. This is very annoying and seems unnecessary. The trustee has been approached and seems unconcerned. He is reportedly running legal limit and is on a high tower. Some of us were discussing what course of action was available to us to get this problem resolved. We came up blank. I'm sure the FCC doesn't want to hear it, coordination maybe? Anybody been through this before? Any suggestions?

: tu' type. You often get a chance to TALK to the other person. For those who
: kinda new to the DXing thing, alot of 'common' (READ EUROPE) can found on
: 30m. Also alot of ZL and VK. ZL1AMO always includes 30m when DXpeditioning
: the Pacific islands (currently on 3d2r).
: --scott

Another thing favoring 30m is the fact that DX worked there *doesn't*
count for DXCC. Kinda helps reduce pile-ups a bit...

Since it stays open later than 20m, its a good band if you only get
to work DX after you're done with the dinner dishes ;-)

> Also, you are absolutely right about the issue. As long as you identify
> every 10 minutes and at the end of transmission with full callsign, the
> FCC requirement is fulfilled.
>

True. I just remembered reading in the FCC Rule Book that "tactical" callsigns
are frequently used by amateurs when they do service work at different events.
These call signs, using names that may describe where the ham is or his/her
primary duty, are perfectly legal as long as the ham gives his/her FCC-issued
callsign every 10 minutes and at the end of a QSO.

Just $0.02

John,

I'd recommend that you have your class stay away (for now) from the QRP stuff until they get their feet wet on the bands. I take it you're talking about HF and not 2 meters by the description of the rigs (Drake twins, etc). I'd recommend some of the Kenwood TS-520 series, Kenwood TS-820 series, Yaesu FT-101 series, etc. These rigs are "hybrids" which have solid state front end's and tube drivers/finals. This is a good way for these new hams to get the "hang" of what they were studing about tuned circuits, etc. Also, these older rigs are a bit more forgiving in cases of high SWR, and other problems. The tubes are still rather cheap, the rigs are in the $300-$500 range and most have cw filters (a necessity!! make sure that the rig has one before buying because the cost is pretty high to get one!). Also, when these folks upgrade (or on 10 meters), they can operate phone if they want to with the rig that they have and not have to fight propagation with a 1 to 2 watt signal. If that's their direction after they get accustomed to ham operating, then

wonderful, QRP is a lot of fun and can be quite exciting especially at the milliwatt level, but most new hams have enough trouble without a weak signal coming from their rig to make and keep a QSO going especially on 40 and 80 meters. Check the yellow sheets, hamfests, and there are several different swap nets (on HF and VHF) that have gear listed for sale. One east coast swap net is on Monday and Friday starting at 8:00 on 3.890 MHz and another is on Wednesday night starting at 8:00 on 3.910 MHz. I'm sure that there are others in the mid-west and on the west coast. You'll have to do some looking and keep that telephone close by, cuz the red hot deals go fast!!

Good Luck

Joe KI3B

I thought that's why they had CTCSS tones. Why not have one of the repeaters
on a tone so as to illiminate the problem.

4437. Need help finding kits!!!

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 16:18:24 UTC
From: bowersda@cc.uvcc.edu
Message-ID: <1993Jun30.091824.1@cc.uvcc.edu>
Source record: 279651

I was hoping someone out there might be able to help...

My friend Tracy and I just passed our no-code tech tests 2-weeks ago and while awaiting our licenses were hoping to start work building some kits and learning more about our new hobby/avocation.

The problem is, we can't seem to be able to find any place to get kits for mobile or base ham bands. Can someone out in netland guide us to a company that sells this type of kit so that we may gain a better understanding of how our equipment operates and what we can do to keep it in good condition besides send it to the factory.

We heard that Heath was out of business B^(and would like to find a similiar type company to work with. My understanding is that RadioShack just sells parts and assembled units.

Any help/pointers/info would be appreciated. Post or E-mail and if anyone else is interested we would be glad to post a summary.

Thanx for your time...

I have read this complaint on the R7 several times now. They sent me
new traps more than once. They finally told me how to tune the traps.
I had to adjust the 30 and 17M traps. The 30M trap resonates about right
on top of WWV as it comes out of the box.

It's hard to believe that Cushcraft keeps shipping them this way. They
must have them manufactured way ahead and don't want to bear the expense
of correcting them.

Other than that it works well. (After I adjusted the traps). Well designed.
I don't understand why they can't tune them right before they ship them or
at least send you one that is tuned right.

>hear it, coordination maybe? Anybody been through this before? Any suggestions?

I'm not sure exactly what the problem is here. There doesn't seem to be
a coordination problem as the users of the CT repeater are not bringing
up the Mass. repeater or vice versa. Does the signal from the CT
repeater actially cause interfearence with the output of the Mass.
repeater if both signals are present? If not, then it seems the
complaint is that the CT signal probably is strong enough when
the Mass. repeater is not transmitting that the Mass hams that are
monitoring 147.315 have their squelch over ridden and they end
up listening to the CT repeater. I suppose that's annoying, especially
if in a scanning mode, but that's not really any type of interfearence
problem or coordination problem as far as I can tell.

Best technical solution is to have the Mass repeater add a tone activated
squelch signal.

Final note, I think if the distance was measured from central
Mass to the repeater in CT, I doubt it would be a couple hundred miles.
New York City to Boston is only 250 miles by car, and that's sure not
line-of-sight.

I could not agree more with Brian. The commercial services have been doing this and have been required to do it for many, many years. This was also brought up at the NESMC BOD meeting recently and at a previous NESMC (New England Spectrum Management Council) general membership meeting. The recommendation was exactly as Brian suggested; install tone encode on the repeater transmitter; cost is about $20, very cheap solution.

|> hat is wrong. Thanks!
|>

RTTY is received using Lower Sideband, so you'd need an SSB receiver for that. To receive CW you also need some sort of receiver that can provide a BFO or whatever. An SSB receiver works fine for CW. Your AM receiver is really not enough for either.

With an SSB receiver, tune to 14.080 - 14.090, and listen for a two-tone warbling sound. RTTY will occasionally stop with only one of the two tones being sent (the person has stopped typing, probably trying to think of what to say next).

Other modes you may hear in the area include PACTOR (bursts of 1/2 second or so?), AMTOR (sounds like crickets chirping, and HF Packet (Brrraaaapppp noise). Your simple decoder circuit should work for the RTTY, but probably not for the others unless the software is pretty advanced.

Good luck!!

Posted-By: auto-faq 2.4
Archive-name: radio/personal-intro
Revision: 1.4 06/30/93 12:04:14
Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July weekly
August bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

ALthough I agree that we have no expectation of exclusivity of a frequency,
we still need to share the spectrum in a responsible manner. Running legal
limit which reaches into areas with other coordinated repeaters, that
you have no chance of receiving from, is just irresponsible in my book.
We could do the same, run legal limit, put it on a beam pointed south,
does that solve the problem? Requiring all the users to buy PL decode
boards is not an ideal option either. I guess I don't really expect a
resolution to this problem, but where does it end?

Very cheap for the repeater owner perhaps, but not the users. Perhaps you
didn't notice that PL decode is optional on most mobile rigs? Again, your
answer is "let them do what ever they want, you'll have to compensate".
This is a cop-out. If everyone's running legal limit with PLs, what a fine
mess we'll have. Sounds like the foxes are watching the chicken coup.

Maybe now that the sunspot cycle is heading for the abyss... but I had no trouble at all last summer with 20 watts PEP and a dipole. Now if you're busting through a DX pileup or working a hot contest, that's different. 100W or less is no trouble for casual operating.

But when the power supply crapped out -- that was trouble! Anybody know of a source for high-voltage filter caps?

>repeater if both signals are present? If not, then it seems the

Yes, the signal is often strong enough that it mixes with the local repeater causing you to not be able to understand the output. Other times (anytime the CT machine is up mostly) it just opens your squelch. Yes, I realize we can force everyone to buy PL. The repeater has a tone on the output already. It still doesn't answer the question of responsible use of the spectrum. If every repeater ran legal limit, no matter if they needed to or not, it would be havoc. Not to mention illegal, you see there's this little "no more than necessary" law that most hams ignore on a regular basis. I'm really surprised by the tone of responses I've received so far. Most seem to be of the "tough, if you din't like it go PL" tone, not what I expected.

I did overstate the mileage, looks like 100 to 125 miles rather than 200, it was just a guess.

I hope to be active from 5H for 3 months starting July 4th or so, on the HF bands, mostly CW. Would be pleased to hear any net-folk, and would do my best to accommodate skeds on various bands whilst there, so feel free to ask, if anybody does hear me. Probably will have a fairly weak signal into NA due to power (and antenna) limitations. Would also be happy to try 2-way QRP upon request, and may occasionally be found on the QRP frequencies anyway, though I don't anticipate too much success on that front.

I don't know what call I'll be issued yet, as that'll probably be finalised when I get there, but I may use 5H3FE (poss. 'FOE) in Dar-es-Salaam, which is the call of the university engineering faculty station. Will probably operate from various locations around the country, as I'll be travelling with the work, staying approx 1 week in most of the places on the agenda (Dar, Tanga, Moshi, Arusha, Mwanza, Mbeya and one or two others).

QSLs will be via my home call, either direct (ssae please) or buro, though obviously nothing will be done until approx October when I'm settled back here.

Cross-posted to: rec.radio.amateur.misc,rec.sci.electronics

I've a friend at the California Department of Transportation (CalTrans) who's doing some research and would like your advice. They'd like to monitor the handshake signals sent between a cellular car phone and the cellular site to determine a vehicle's location along the freeway. By getting signals from the same car at two or three different time intervals, they're hoping to determine vehicle speed along a given stretch of highway. This info would be fed to metering ramp controllers and local traffic monitoring stations for flow control and traveller advisories.

Sounds pretty simple, yes, but they'd like to be able to do it with one receiver site along a given stretch of road. Hence the need for rapid directional information from one location. The road's path and receiver location are known quantities, so only a bearing to the vehicle is needed to obtain it's location on the highway.

Can you offer any personal insight into the feasibility of such an RDF antenna system, and if so, how to implement it? Any thoughts on possible heading resolution available using various techniques at the 900MHz (or so) cellular frequencies? Could the antenna be fixed, yet offer directional information over, say, a 180 degree spread? Any personal recommendations on excellent texts on the subject? Any and all help will be greatly appreciated, and may some day even help you by reducing traffic congestion on your local highway :)

Cheers,
Alan

Any worthwhile controller will have a "watchdog timer". The timer runs
continuously, and will reset the CPU when it times out, if the
CPU doesn't reset the timer first. While the CPU is executing
its regular program, it resets the timer at intervals short enough so that
the timer never times out. When the CPU has crashed, the watchdog timer
runs out and resets the CPU.

Well look, dude, the only other solution that will work is for you or them to change frequency.

If you have to share the frequency, CTCSS is the right answer.

Reducing power DOESN'T work. If they're S5 to S7, they could drop from 100 watts to 1 watt and you'll still hear them just fine. There will probably still be spots in town where you won't be able to tighten your squelch enough that you won't hear them.

Of course, the assumption is that they're on "your" frequency because they were coordinated there. Typically coordinations are granted on a trial basis. Can you find them another frequency they can use that won't annoy anyone? Or can you find another frequency your system can move to that won't annoy anyone? It's rare enough nowadays that any area of the country has enough unused frequencies that you CAN find one. If you can, then that's an answer.

Otherwise, you're stuck.
- Brian

PUHLEEEZE! I'm so tired of listening to people whine about putting a $40 PL decoder in their $300 radios. The commercial radio guys have used PL for decades now to combat exactly the scenario described in this post. Why are hams so darn cheap anyway?

I'd also bet that the guy isn't running "legal limit" 1500 Watts on a repeater transmitter would be hard to maintain...He probably just has a good site.

Quit whining and cough up the $40.

>
> Does anyone have any experience on 20 QRP or 18 MHZ?

I'd say 20 m is your best bet. 40 has a lot of QRN esp. during summer.
18 isn't as heavily populated as the other bands and with the declining
solar activity, 15 will be less popular. 14.060 Mc is the international
QRP freq. on 20m.
I have fond memories of my HW-8, a pair of lantern batteries and an
inverted vee (apex at 10') on a beach. 2 watts was easily heard all over
Europe. Then there was my VO7NA/MM/QRP operation on a 37' boat 5 years
ago. I still find it hard to believe I worked all continents with
less than 2 watts output on 20m.
The secret to QRP operation is patience, persistence and a good antenna.
Have fun!!

> count for DXCC. Kinda helps reduce pile-ups a bit...

Is this true?

I know you can't get a 5BDXCC endorsement on 30. From the rules:

The 5BDXCC is endorsable for these additional bands: 160, 17, 12,
6, and 2 meters. 5BDXCC qualifiers are eligible for an
individually engraved plaque (at a charge of $25.00 US).

I operated with N7TNI and new tech as co-ops from Fort Flagler State Park, WA (on the Olympic Penisula -- the top left corner of the map for the non-WA amongst you!) as the novice station, N7WIM on the site of K7LED, the Mike and Key club of Seattle.

As usual 10m varied from weak signal locals to sounding like 20m. For us the band was open at the start (11am to 1pm local), then it reopened on Sat night (8pm to 11pm local), then the next morning (9am to 11am local). Fooled a few people in CO with an S9 signal, and one ope in NH was suprised to hear us (I was suprised to hear them!).

We ran 3 element 10m monobander at 30 foot (I got volunteered to climb the tower -- a first for me) fed by a ic-725 running 100W. The station was located on a bluff about 100 feet above the beach. This gives a 180 view (N to S) across seawater. Gives good low angle radiation :-).

From looking at the log sheets we got about 260 QSOs (we didn't dupe check as we went along, but our memories caught a few!). Al SSB, no CW. I expect we beat last years total of 230 Qs. With a little more effort (and perhaps some more ops we could have hit 300 Qs.

I don't have logs with me (chairman has them) but I can remember working the following states:

id, ca, az, nm, tx, ok, ks, mi, ms, nh,
ma, nj, ny, fl, ga, tn, ky, oh, nb, nd,
sd, mt, wy, ut, wi, hi, la, ar, pa, md,
wv, wa, nc, sc, in, il, co

where was delaware and nevada!

all ten call districts

ve2, ve3, ve7,

best DX (only DX!) was FG5.

I enjoyed it (even though I was laid low with a bad headache for Sat afternoon).

4458. Closed Autopatches

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 19:15:20 UTC
From: yee@mipgsun.mipg.upenn.edu
Message-ID: <134084@netnews.upenn.edu>
Source record: 279687

I have a question regarding the FCC regulations concerning closed autopatches.

The existance of closed repeaters is legal under 97.85(a) which states, "Provisions to limit automatically the access to a station in repeater operation may be incorporated but are not mandatory." Since the autopatch is part of the station, closed autopatches are by extension also legal.

On the other hand, under 97.117, the use of codes are prohibited. "...where the intent is not to obscure the meaning but only to facilitate communications."

The only place that I can think of where the use of codes are indeed legal are in 97.421(a) for satellite control where "Stations in telecommand operation may transmit special codes intended to obscure the meaning of command messages to the station in space operation."

Now for my first question, are the use of access codes to control the autopatch legal? It can be argued that the access codes fall under 97.88(g) where "each remotely controlled station shall be protected against unauthorized station operation, whether caused by activation of the control link, or otherwise. On the other hand, the intent of the access code is to obsure the meaning of the command message and under 97.117, "the transmission by radio of messages in codes or ciphers in domestic and international communications to or between amateur stations is prohibited." Protection by radio appears to be forbidden. Furthermore, it appears to me that amateurs ARE authorized to operate the station.

It can be argued that the access codes are NOT codes at all but that they are simply not generally not known but that would put the access codes in violation of 97.117 since they are not "generally recognized abbreviations established by regulation or custom".

For my second question, are the use of the access codes by those who are not supposed to be privy to them legal? There is no "expectation of privacy" so simply listening to the appropriate frequencies is all that is needed to obtain the codes. Furthermore, the transmission of the codes are legal since they are transmissions in the amateur band. I can find no reference in 97 which would indicate that the use of the codes by all amateurs is indeed illegal.

My final question concerning closed autopatches is somewhat complicated. Many clubs give access to autopatches only to club members. If the payment of dues is for access to the autopatch, then

the closed autopatch is clearly illegal under 97.112(a), "an amateur station shall not be used to transmit or receive messages for hire, nor for communication for material compensation, direct or indirect, paid or promised." The payment of dues is for membership to the club and access to the autopatch is a fringe benefit. I applied for membership to the Holmesburg Amateur Radio Club in Philadelphia, PA and was denied (more later). Legally, am I allowed to access the autopatch anyway? While they can legally deny my membership, can they legally deny access to the autopatch? If they deny access for the autopatch it would be implication that the payment of dues is required for access. This would be illegal under 97.112(a).

To provide background of the particular situation. I applied for membership to the Holmesburg Amateur Radio Club and was denied membership on 6/29/93. The club requires a copy of my amateur license as part of the application but they could not give a reason for this. At first, they said that it was to prove I was an amateur. I showed one member of the Board of Directors my license. The rest refused to look at it. A copy of my license is not required to satisfy the need of establishing my status as an amateur. The operation of a club station is not at issue. In the end, they refused my application. The only reason was the lack of a photocopy of my license. They also invited my to resubmit my application with the "required" photocopy and that if I thought the requirement was unjust that it have to be fought as a member of the club. The only way to become a member of the club is to submit a photocopy of the license (Catch-22).

Since there is no need for them to have a copy of my license on file, I feel that the requirement is unjust and I refused to submit it.

>
>Scott Ginsburg Voice: 508-436-3836

Also from the rules:

#1 Honor Roll: To qualify for a Mixed, Phone or CW Number One plaque, you must have worked every country on the current DXCC Countries List. Write the DXCC Desk for details.

2) Written proof (confirmations, ie, QSL cards) of having made two-way communication must be submitted directly to ARRL Headquarters for all DXCC countries claimed. Electronically transmitted confirmations (including, but not limited to, FAX, telex and telegram) are not acceptable for DXCC purposes. Applicants for their first DXCC award may have the cards checked by ARRL DXCC Field Representatives-see Section V for details. The use of the official DXCC application forms or an approved facsimile (eg, produced by a computer program) is required. Complete application materials are available from ARRL Headquarters. Confirmations for a total of 100 or more countries must be included with your first application. By ARRL Board of Directors action, 10-MHz confirmations are creditable to the Mixed, CW and RTTY awards only.

30m contacts are good for dxcc, but 5bdxcc.

>He wonders if anyone has done a conversion to 6146's?

>Anyone know anything about this?

I don't have my tube manuals at work but I seem to remember that the
6LQ6s were rated at a temporary overload of 200w for 30seconds. I don't
think the 6146B's were rated the same way. It may be possible, but not
with the same power output. (but probably a cleaner output..)

>flow control and traveller advisories.

Yeesh! Big Brother strikes again! I suppose the information will
also go to an automatic ticket-writing computer whenever a vehicle's
speed exceeds 55 MPH, or whatever the limit is along that particular
stretch of highway. After all, they're already obtaining this
information for "flow control and traveller advisories", and this
would allow them to make some money while they were at it...since the
cellular phone information can be used to determine which telephone
and thus which vehicle is sending out the signals, they can just mail
the tickets to the registered owner's address and save themselves a
lot of trouble while they're fleecing him or her. Feh! Sigh.

In article <20sloqINNd1b@network.ucsd.edu> brian@nothing.ucsd.edu (Brian Kantor) writes:
>Well look, dude, the only other solution that will work is for you or
>them to change frequency.
>
>If you have to share the frequency, CTCSS is the right answer.

It's not the right answer if the users of his repeater are receiving his repeater at S5 and the CT repeater at S7.

It's also not the right answer when a hundred repeater users all have to go out and buy CTCSS decode units for their radios.

What happened to the "minimum power to maintain communications" guideline?

>Reducing power DOESN'T work. If they're S5 to S7, they could drop from
>100 watts to 1 watt and you'll still hear them just fine.

If they were at 100 watts that might be true. The original poster said they were running at the legal limit, on a high tower. Why does a repeater need that much power, under *any* circumstances? It would seem to me that a repeater running a kilowatt is going to be heard by probably twice as many people as it can hear. This begs the question of what purpose the repeater is in service for. Is it there for FM Dxers with a kilowatt and a beam 300+ miles away to wet their pants over kerchunking once a week, or is it there to provide local area communications capability to mobile and portable stations?

But then again, I don't actually know how much power most repeaters transmit with. The one I use most often locally (Central NC, not nearly as crowded spectrum-wise as New England) runs, I have been told, 50 watts. I can hear it just fine most anywhere in the region (radius of about 40 miles) that I'm likely to drive on a regular basis, and I can hit it with 3 watts in most places and 50 watts on the fringe. I can also hit it with 3 watts, and receive it S9, from a 2500 ft hilltop about 90 miles away. This repeater has a pretty low antenna; there are other local repeaters with much better coverage that have higher antennas, but I don't think they run anywhere near legal limit.

So, what *is* the average transmit power of a 2m repeater?

>Of course, the assumption is that they're on "your" frequency because
>they were coordinated there. Typically coordinations are granted on a
>trial basis. Can you find them another frequency they can use that
>won't annoy anyone? Or can you find another frequency your system can
>move to that won't annoy anyone? It's rare enough nowadays that any
>area of the country has enough unused frequencies that you CAN find
>one. If you can, then that's an answer.

Could part of the reason that "it's rare enough nowadays that any area of the country has enough unused frequencies" be that some repeaters are transmitting farther than they can receive?

Well, you learn something new every day. Turns out this rule has changed
in the last few years. The 1988 Operating Manual I have says simply:

"By ARRL Board of Derctors action, 10-Mhz confirmations
are not creditable for DXCC"

However, the electronic copy of the DXCC rules I downloaded a couple
of months ago says:

"By ARRL Board of Directors action, 10-MHz confirmations are creditable
to the Mixed, CW and RTTY awards only."

Guess I have a couple of more DXCC countries confirmed than I thought!

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 21:13:27 UTC
From: wejones@cbda7.apgea.army.mil
Message-ID: <9306301713.aa05434@cbda7.apgea.army.mil>
Source record: 279685

Does anyone know of a document describing how to program the BAYCOM
packet tnc, preferably something describing how the resident program L2
works? I would like to write my own special purpose terminal program
to replace scc, and was hoping that the L2 program would take care of the
AX25 conversion, but I was not sure how to read and write to/from L2.
It would be nice if with L2 in place, you just read/write to the serial
port, but I don't think so.
Secondly, there is another program called "TFPCX" in the BAYCOM archive
at UCSD, the documentation for which is in German. Does anyone know what
this program does?
Thanks in advance B.J. N3JLQ

Last-modified: $Date: 1993/05/16 21:57 $
Version: $Revision: 1.05 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu

4472. FCC....How long?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 21:27:34 UTC
From: joes@hpwala.wal.hp.com
Message-ID: <4611@hpwala.wal.hp.com>
Source record: 279712

I sent in my license renewal form about a month ago. I realize that one month isn't very long by FCC standards, but I wonder what people's experience has been on this. Since I have no way of confirming that they received my application for renewal I'd like to know how long a wait is typical.

Thanks.

> new.

The 30 Meter SWR curve for the R7 is flat and mediocre accross the band.
The resonant point for mine has always been well below 10MHz. I believe
this is a known problem. I don't think mine is as bad as 3:1, but it's
nowhere near as good as other bands. 17 works fine for me. In anycase,
my SWR plots met or exceeded those in the instruction booklet, so I didn't
worry.

>
[the rest deleted]

QSOs on 30-m band can count for mixed, cw or rtty DXCC awards. There are
no 30-m endorsements, (such as for 5-band DXCC). Most people chose to
chase mixed, cw and rtty counters on other bands.

4476. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 22:21:27 UTC
From: tkelso@afit.af.mil
Message-ID: <1993Jun30.222127.26207@afit.af.mil>
Source record: 279711
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Does nayone have any circuits and/or software that can interface
my Yaesu FT757GX CAT Transceiver to my IBM computer.
I would like to use the computer for direct frequency entry into
the FT757GX.

Thanks in advance.
Bob N8JDT

4478. Portable antennas?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-30 23:17:19 UTC
From: laurahal@microsoft.com
Message-ID: <1993Jun30.231719.1753@microsoft.com>
Source record: 279700

I'm visiting family out in the country in a couple of weeks,
and plan on taking radio stuff with me. The pleasant dilemma
is that my parents live on 15 acres, so antennas aren't the
hassle they represent in my apartment.

Until I pass my next code test 80m is my HF band of choice, and
a full-size dipole strung between trees is certainly an option.
Would anybody out on the net have any other suggestions/ideas?

73 from Vacouver,
laura VE7LDH

P.S. Yes, I know about rec.radio.amateur.antennas et al, but our site
didn't get the newgroup messages. And from what I hear, we're not the
only ones...

Yeah, when I read that bunch of pilpul, I started wondering
what they'd done to piss you off.

No, they don't need you to submit a copy of your license. It's public
information and they (or anyone else) can get a copy of it from the FCC.
It's just cheaper and faster for them to get it from you.

Y'know, this use-the-law-for-revenge is really childish. Aren't you
being just a bit touchy?

> any more CW contacts).

Yes I have to agree with you here...FD is not the time to show someone how courteous the CW subbands are. It's actually a waste of time to ask if the frequency's in use anyway...of course it is. I tried asking once and someone came back with "NO" right on frequency :-) What it boils down to is, whoever has the loudest mouth and the biggest ears, wins. It's a real challenge to pick out individual CW signals from the middle of a big mess like I was hearing on 40M after dark. But when you can do it, boy is it great!

> 2) It also seemed to me that the major focus of FD is the
> contest and not the emergency preparedness function?
> How does FD prepare us for emergency action? I guess it
> also depends on the group of people you are working with!
>

The emergency preparedness comes in as clubs need to maintain their equipment for FD, set it up, and take it down for the contest. In a real emergency, hopefully this equipement can be put into service as quickly as it is for Field Day. FD gives practice at setting up portable stations, and also gives clubs a pool of available equipment to draw from in a real emergency.

Source record: 279689

>Perfectly ok to run the twin lead back to a tuner. However, then
>the antenna is no longer a multi-band (tunerless) antenna.
>
>Cheers, 73 Ed Humphries N5RCK

Hi Ed,

I don't agree with equating multi-band and tunerless. Using an antenna tuner makes my random-length center-fed a multi-band antenna. It works a LOT better than my G5RV did. Using coax on non-resonant antennas is just a bad idea because ladder-line is twice as good and half the price. (Anybody want a cheap used G5RV?)

There will be a high SWR at the coax/twin-lead junction on most bands when using a non-resonant antenna. Coiling the coax may choke the RF but results in additional losses and it changes the SWR little if at all. Just because you measure a low SWR at the transmitter doesn't mean anything useful with non-resonant antennas. A 50 ohm resistor will do the same thing.

RG-58 has 1.5 db loss per 100' on 20 meters when perfectly matched. With an SWR of 10/1 at the coax/twin-lead junction, an additional 3 db will be lost. 100' of 300 ohm ladder-line has 0.4 db loss per 100' on 20 meters when perfectly matched. With an SWR of 10/1, only an additional 1 db will be lost.

Coax loss = 4.5 db. Ladder-line loss = 1.4 db. You will radiate TWICE as much power with ladder-line transmission line under SWR = 10/1 conditions. (Even when the SWR is 1/1, ladder-line will give you an extra db.)

Coax is ok for antennas that match it's characteristic impedence. It is lousy and lossy for non-resonant antennas.

Sure, every club has speakers. I mentioned I was often one. This
is how I get to visit all these clubs. I then mentioned that clubs talk
about the subjects above - even yours, as you are going to prove below:

>
>Of course we also had "business" topics. When the repeater amplifier
>broke, the appropriate committee reported what happen, what action
>was being taken, and what (if anything) was needed from other members.

This subject was described by me as: "What's wrong with the club
repeater and when are we going to fix it."

>The field day committee recruited help as needed and ran _very_ nice
>FD activities the three years I was involved (missed them this year!).

This subject was described by me as:

" 1. What we are going to do on field day.
2. What we did on field day."
>
>With the volume of talent and knowledge amoung amatuers, it seems to me
>that any club with the dull agenda listed by Julian (er, excuse me,
>Wayne Greene!) has officers who aren't even trying and members who are
>letting them get away with it!

Well, your club seems no differnt than the clubs I described.

: -Steve

Don't be paranoid, Steve, there are no plans to log the ESN information obtained from the phones -- only to hold them in a queue until the vehicle's second location data is obtained. The ESN will then be flushed from the queue. Sure, the information obtained *could* be used as you've indicated, but my friend at CalTrans is very much like you and me -- a normal, average guy, who has been known to exceed the speed limit a time or two (ahem). I don't think he'd be interested in helping anyone give him a ticket. I'm sure the ACLU would be all over the discriminatory practice of singling out those with cellular phones as targets for moving violations. What CalTrans is proposing is an interesting application of existing technology to help you and me get to work on time. Nothing more. I'd still appreciate any *useful* input the net can offer to overcome the tehnical hurdles involved. Thanks and cheers!

: please sed mail as I don't get to this conference often, thanks in advance.

If you remember to insert a straight pin through the coax at quarter-wave
intervals you will find that you can run as long a feedline as needed
without any additional loss.
Be sure to clip off the ends of the pins where they pass through the coax to
prevent any spurious emissions.
Soldering the pins on each side of the coax is recommended, naturally.
We radio amateurs are eternally envious that this stratagem only works on
the C.B. band.

[828]
ERITERA DXPEDITION

A very special kind of Norwegian sponsored DXpedition to Asmara, Eritrea has had a major impact on that country and on all of Amateur Radio. The operation ran from May 31st to June 9th was a success in more ways than just the number of contacts that were made.
According to Erling Wiig, LA6VM the operation began several days before the first QSO was made with the group sponsoring ham radio introductory seminars at the Telecom Authority of Eritrea and at Asmara Technical School. LA6VM says that the three day seminar held at the Telecom office had about fifteen participants. This was followed by the four day seminar that was held at the Technical School with about thirty-five attendees. DXpedition party members also assisted the school in re-starting its radio club, began code training, gave out free books and training materials and installed a new ham station at the educational facility. The Icom built equipment replaces a five-decade old non-working station. Wiig notes that it is already being used in lectures to give hands-on demonstrations of electronics and communication theory.
Operationally, the DXpedition went on the air at 18:30 UTC on June 1st. The last contact was made on June 9th at 06:20 UTC. It used the call E35X and made about 20,000 QSOs with 125 countries. The operation took place mainly on 10, 15 and 20 meter SSB and CW with some contacts on 40, 80, and 160 meters and on RTTY.
The Erithera DXpedition was far more than a way to make a lot of quick contacts. Thanks to the careful planning by its organizers, this operation was an international gesture of good will. This in turn also made it a major political coup for all of Amateur Radio.

*****
VEC MEETING

The annual conference of the nation's VEC's was held June 17th and 18th at the FCC's license processing facility in Gettysburg, Pennsylvania. Several important topics discussed. Items brought to the table this year included instant callsigns.

Jim Georgias W9JUG, is administrator manager of the Great Lakes Amateur Radio Club VEC.

"The FCC has proposed that a temporary callsign be issued to new applicants. This temporary callsign would be issued at the

test session when the applicant has passed the required elements. The FCC stated that it would generate a proposal for rulemaking on this subject."

The FCC also clarified the term conflict of interest as defined in part 97.515 relating to volunteer examiners.

Jim Georgias stated "Any person who owns a significant interest in or is an employee of any company or other entity that is engaged the manufacture or distribution of equipment used in connection with amateur radio transmissions or in the preparation or distribution of any publication used in preparation for obtaining an amateur radio licenses is ineligible to be an administering VE. That's the VE that gives the test. As result of this interpretation by the FCC a VE that is an instructor may not function as an administering VE for his class or any body else."
Also at this years conference the FCC announced the release of a new 610 form designed to curb abuse in the morse code element credit program for the severely disabled.
A program reviewing this national VEC conference will be available until July 2nd via the RAIN Dial-up at (708) 299-INFO.
More on the future of the VEC testing program in future Newsline reports.

*****
SAREX

Another SAREX equipped space shuttle is in orbit.
Hundreds of students and thousands of packet operators are enjoying the flight of Endeavour.
STS-57...the flight of Endeavour...is the tenth flight of a Space Shuttle carrying amateur radio...and it's the third mission of five scheduled in 1993. Licensed operators on board are the pilot, Brian Duffy, N5WQC, and Mission Specialist Janice Voss. This is a voice and packet flight, with emphasis on the latter due to a very restrictive hamming timetable as the astronauts recover a four and a half ton satellite called Eureca. They also have nearly 100 experiments to conduct in a brand new commercial space laboratory, Spacehab, in the shuttle's cargo bay. NASA has leased all but one of the 43 lockers onboard at a cost to customers of nearly a million dollars a locker. SAREX is allowed to ride free because of the public service it does.
On this mission, Duffy and Voss plan 8 contacts with schools...five in the United States, one each in South Africa, Mexico and Australia.
A footnote...to date, for missions STS-35 through STS-55, the flights before this one...students have participated in scheduled contacts at 124 schools, 5 museums, two space camp groups and one science center. It's estimated that 15,740 students have either talked or listened to the conversations with the astronauts...and

that does not include hundreds of schools who have had listen only facilities or have listened to WA3NAN at the Goddard Space Center as it repeated the contacts on 20 and 40 meters.

*****
CLINTON TO BUILD SPACE STATION

President Clinton has decided to proceed with a slimmed-down space station project. The New York Times reported on June 17th that the president had signed off on a plan to spend about $10.5 billion over 5 years for the space platform. The Times said Clinton has chosen a combination of two alternatives that are based largely on the original design of space station Freedom. A House panel earlier this year approved spending $15.16 billion on the projects through the rest of the decade. But the president put the project on hold and asked for NASA to offer him a less expensive version.
NASA Engineers recently provided President Clinton with three design options for a smaller, less costly version of the space station. Two of the options were based on the designs of the original Space Station Freedom. A third design, known as Option C, is cylindrical in shape and is the least expensive.
Ham radio has been a part of manned space operations for well over a decade. Its known that leaders in the amateur community are already at work at getting a permanent Amateur Radio station included in the space station design.

*****
SPECTRUM

Spectrum is a new international communications and technology radio program. The show airs Sundays at 03:35 UTC over WWCR radio on 7.435 Mhz. It can also be heard by satellite over the Let's Talk Radio Network on GTE Spacenet 3, Transponder 21, on the 5.8 Mhz Audio Subcarrier.
Spectrum is hosted by Dave Marthouse, N2AAM a long time radio enthusiast and professional broadcaster. His co-host is Mark Emanuele a professional communications consultant. The program is underwritten by Overleaf International. Overleaf is a New Jersey based Data Processing and Telecommunications Consulting Firm.

*****
HAM SHOWS ANNOUNCES SCHEDULE

If you happen to live near one of five key cities and enjoy a good ham radio convention, then 1994 will be an exciting year for you. That's because Mike Forsyth's company Ham Shows has announced the dates and venues for next year's mega events. January 8th and 9th will see Ham Show's kick-off the convention season at the Town And County Hotel in San Diego, California. Two weeks later, January 29th and 30th Ham Shows

will be in Northern California at the Santa Clara Convention Center just south of San Francisco. July 30th and 31st will see a mid-west Ham Show at the Pheasant Run Resort and Convention Center near Chicago, Illinois, followed on August 6th and 7th with an event at the Eastern States Exposition Center in Springfield, Mass. Forsythe will round out 1994 with a Ham Show on August 27th an 28th 1994 at the same location that the 1993 Ham Show is taking place That's the Valley Forge Convention Center in Valley Forge, Pennsylvania.
Forsyth says that each Ham Show is designed to attract up to fifty-thousand attendees from an area of two hundred miles surrounding a given convention site. Already, every major manufacturer has signed on to exhibit at the first Ham Show slated later this summer for the weekend of August 21st and 22nd at the Valley Forge location. Many seem to believe that mega-events like Ham Shows is what the future of ham radio conventions is all about.

*****
CQ HALL OF FAME

CQ Magazine has inducted six new members into it's CQ Contest Hall of Fame. The six are Fred Laun K3ZO, Frank Anzalone W1WY, Jim Lawson W2PV, Ed Bissell W3AU, Rush Drake W7RM and former ARRL President Victor C. Clark, W4KFC.

*****
GHANA ON THE AIR

In DX, word that Ghanna is back on the air. The nation actually came back to the world of Amateur Radio back on March the 28th. To mark the occasion, Kofi Jackson 9G1AJ, the director of the Ghana Frequency Registration and Control Board held the first QSO with PA0LOU. He is the chairman of IARU region 1. Later 9G1AA was operated by members of the Dutch Da Goe' Foundation and made the first open QSO's after 7 years of non-activity.

*****
NARA NON PROFIT STATUS

The National Amateur Radio Association says it has a better idea. An idea for radio clubs wanting the advantages that come with holding non profit status.
As you already know, NARA is a nationwide non-profit 501c3 educational group founded by Don Stoner W6TNS. Its primary objective is to represent the political needs of Novice and Technician class license holders. NARA has now found a way that almost every radio club in the nation can qualify for non-profit status as well.
Stoner says that his organization has been successful in obtaining a group exemption letter from the Internal Revenue

Service. He explains that this is a provision in the Tax Code that will permit NARA to grant non-profit status to certain kinds of NARA affiliated groups. Stoner calls it the NARA Group Affiliation Program, and whether or not your group qualifies can be easily determined by getting a copy of IRS publication number 557. The information needed can be found in chapter 1 on page 5. The only catch is that a group wanting this status must affiliate itself with the National Amateur Radio Association, but Stoner notes there are a number of advantages to doing this. He believes that one of the most important is that non-profit status provides an entree to the United States Post Office to obtain non-profit mailing privileges. Organizations approved as non-profit mailers by the post office can receive significant reductions in their mailing expenses. Few radio clubs can afford to overlook this aspect of the offer.
Stoner believes that most radio clubs, VEC's, VE's and similar organizations can become part of NARA's group affiliation program. Don says that he has prepared a pamphlet that explains every aspect of the program. To get a copy simply send a request for publication GAP001 from the National Amateur Radio Association, Post Office Box 201407, Arlington, Texas 76006.

We were about 120 miles north east of you, on the Mogollon Rim. 10M had some pretty good openings for this point in the sunspot cycle... Virgin Islands, Texas, Florida, the north east, and even after everything else went away on 10, there was still one gal from Idaho coming in like she was under the next tree...

73,
Clark

SB DX @ ALLBBS $OPDX.117
Ohio/Penn DX Bulletin No. 117

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 117
BID: $OPDX.117
June 28, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DXMB, DF4RD, ON9BCN, AD1C, K4CEF & Southeastern Cluster Group, KC6CEX and K6OZL for the following DX information.

5A, LIBYA (STATUS REPORT). Most of this week's information was reported by ED, NT2X, who has received phone calls from Romeo. The following was reported from the phone conversations: Romeo and a second operator remain in Libya and are doing find. They have been there since the start of the first reports of operation (ed. No date was mentioned, but we are assuming around June 16th.). Their DXpedition was temporarily off the air for reasons not related to amateur radio. The group was ordered to shut down their amplifiers after the first few hours because of interference (He did not say TVI.), but that order has now been rescinded. Romeo told Ed, that they would be back on the air in 24-48 hours, which would have been around June 25th (ed. But no reports as of June 27th.). They plan to stay until June 30th or July 1st.
A discussion took place on Romeo's uses of a 100 kHz-wide split. Romeo stated that the 100 kHz spread was only used in the beginning of the operation because they absolutely could not make out the calls using a smaller band spread. The use of a narrower listening range, which has more signals, caused a slower rate of contacts. While a wider range of listening has a faster rate of contacts. In the three and one half hours where they used the 100 kHz spread, they made over a thousand U.S. contacts. Romeo is considering returning to low power simply to reduce the number of callers. He also mentioned that they are not banned from working the U.S. and the group is not on their way to 3V (Tunisia). The earliest the 3V operation will take place is in August.
It was also reported that they have made a friend who is a local commercial radio technician. They have trained him to operate and he may try to get his own license. They are considering leaving the equipment with him. QSL ONLY to BOX 812, Sofia 1000, Bulgaria. DO NOT send cards to NT2X.

6 METERS. This band has been drawing a lot of attention lately. There were many band openings and DX spots reported on the Ohio/Penn DX Network. Stations from stateside, Canada, South America and Western Europe are enjoying the opening.

A2, BOTSWANA. Dave, A22MN, is more or less QRT because of a RFI problem. To make things worse, Dave's QSL Manager, Ken, WA8JOC, has lost his tower and antennas in a storm and will be down for 4-6 weeks. QSLs for A22MN will be very slow in coming out on account of Ken trying to get things back together. (Editor's Note: There has not been any A22 spots on the Ohio/Penn Network since May 22nd.)

D2, ANGOLA. Chris, D2SA, has been very active this past week on 15 meters SSB starting around 1300z for a few hours and again at 1900z. Listen for him between 21250 and 21300 kHz. QSL via F6FNU.

DXPEDITION POSTPONEMENT ANNOUNCED.....
E3, ERITREA. The DXpedition that was to take place at the end of the month has been delayed until the first week of August.
The reason was not given, but details will be forth coming later in July.

BV9, PRATAS ISLAND. The BV9P DXpedition that was scheduled to begin June 25th, is now scheduled to start some time between July 5th and the 15th. The reason reported had something to do with personnal commitments.

OH0 & OJ0, ALAND ISLAND AND MARKET REEF. Javier, AH6MM, who is currently active from Finland signing OH8/AH6MM, is teaming up with Seppo, OH1VR, to be active from these two place. They will be active in the CQ WPX VHF Contest as OJ0/OH1VR and in the IARU Contest as OJ0/AH6MM. They will be on Aland Island July 9th and 12th (call sign not mentioned), and on Market Reef between 9th and 12th. All band operation is presumed.

ON4JUL (BELGIUM), SPECIAL EVENT STATION. This station will operate on July 4th, from 0800 to 1800z, to commemorate the United States national holiday. The station will be operating from the "Supreme Headquaters Allied Powers Europe" (S.H.A.P.E.: A NATO organization) in Casteau/Mons, Belgium. Activity will be on 40 and 20 meters CW/SSB by members of "SARES" (SHAPE Amateur Radio & Electronics Society). SARES was established in 1993 for radio amateurs working at SHAPE whose members are from seven different countries (CT, G, DL, K, ON, PA, SV). QSL via UBA Bureau, Box 400, B-8400 Oostende 1, WV, Belgium.

TN, CONGO. TN1AT has been active this past week (All on nets.). Check 21335 kHz starting around 1430z and 14247 kHz starting around 2130z. QSL via F6FNU.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

4493. Good books on Radio principles ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 03:04:11 UTC
From: mohan@tulip
Message-ID: <1993Jun30.220412.4582@uoft02.utoledo.edu>
Source record: 279707

Hello,

I am interested to know about books which teach fundamentals of Radios.
The library at my school has a lot of books on communication systems and
radio principles, but all of them have intense technical formulae and
mathematics.

Can you suggest a book which has lots of pictures and describes the radio
principles and cover the subject in good detail ?

Thanks a lot for the info :)

from various previous posts. more or less....

>> Also, you are absolutely right about the issue. As long as you identify
>> every 10 minutes and at the end of transmission with full callsign, the
>> FCC requirement is fulfilled.

o.k. i'll ask about the following scenario. you are trying to get a station
to complete a list of qso's. a station that you want. it's a pile up. so
you call "k0" or even "abc" (your call is k0abc) for over 10 minutes and
you haven't been watching the clock. isn't it just better to go ahead and
send k0abc? you are on the safe side, and if you get tired, disgusted or have
to leave you can without jumping on and sending k0abc qrt. is it really that
big a deal (read advantage) to only sending part of the call? my only $.02
left. cul.

This application would be a direct violation of the ECPA. In most cases the phone hands off to the next cell site at the same point on the highway time and time again. In the bay area caltrans is using a vidio camera for flow control and traffic monitoring. The digital image can be interpreted by a computer and the data sent back to a central processing site to get a good overall picture. This system is cheaper than loops in the highway and easier to maintain.

In article <C9G5v4.20p@sugar.NeoSoft.COM> jreese@NeoSoft.com (Jim Reese) writes:

>PUHLEEEZE! I'm so tired of listening to people whine about putting a $40 PL
>decoder in their $300 radios. The commercial radio guys have used PL for
>decades now to combat exactly the scenario described in this post. Why
>are hams so darn cheap anyway?

Unfortunately, the PL needs to be settable in some semi-convenient
way for those who may listen to multiple repeaters. It should get its
tuning information from the memories of the rig. Not everyone runs
single-channel boatorolas.

There should also be some way for the PL demodulator to be able to
tell the scanner mechanism that the signal on this memory is not one
I am interested in, and it should skip that in the scan unless the
correct PL is present. This is not availiable in any PL decoder that
I have seen.

Many of us would have to buy more than a PL decoder. We would need
to buy a rig with a spot for a PL decoder. It would need provisions
for controlling that decoder and interfacing with it.

Then, when the repeaters are that close, we need some way to prevent
the squeals and signal blockages when they come up while ours is in
use, and their repeater output jams our repeater's output.

It is not all that simple.

Alan

Source record: 279719

Bob,

I made an optical link to my FT757GX, using glasfibre. I described it in the Dutch Ham magazine 'Elektron' in 1987 or so. I also have a beta release of control software, written in Turbo-Pascal. You can have the executable if you like.

Another project I did is a stand-alone control unit based on a 6802 microprocessor. It has 100 batery backed up memory channels, a number keyboard an 8 7 segment displays, 2 for channel, 6 for frequency. It is a very nice piece of equipment, and does not have the disadvantages of a computer, less rf distortion, no fan noise, no startup, etc. It's build on a piece of rasterboard, and I'm now looking for someone who can develop a printed circuit board for it. I also like to implement other transceivers, where this is only a software question. The software is coded in 6800 assembly.

If you are interested, please let me know, if there is enough interest, I can develop a PC-board.

regards, Gerrit, PA3BYA

Changes: pit-manager.mit.edu is now rtfm.mit.edu

This administrivia file and the companion Amateur Radio Elmers Resource Directory are intended for non-commercial distribution via Usenet. Any other uses, please E-mail for permission.

A Brief Historical Overview:
++++++++++++++++++++++++++

If there is any one constant in the changing state of the communications art, it is that "Hams" (Amateur Radio Operators) have always been on the forefront of it. Rumors abound where the term "Ham" came from. Some of the more amusing are described at the end of this article.

Regardless of origin of the name, a "Ham" is universally recognizable as one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (W6EZV) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command (1947-1992, now reorganized into a joint command called StratComm) and eventually the U.S. Air Force. Although packet-switching techniques originated from DARPA (Defense Advanced Research Projects Agency) and the ARPANet, no one can deny the tremendous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation), including the development of many ham satellites and the low-orbiting Microsats (communications satellites no bigger than a breadbox that use store-and forward packet techniques), have certainly advanced the state-of-the-art in communications, one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the

benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of amateur radio, and the source of many new hams, particularly those interested in working on emerging technologies.

Even more importantly, Elmers provided an outlet for the impatient newcomer who wanted "to know everything, and right away." Faced with such a request, a good Elmer will smile and proceed to lead the novice through some project or operating experience. Several hours, days, or weeks later, the novice would have his answers, but would have earned them. Even better, the sense of accomplishment would boost the novice's confidence and nudge him or her down the road to being a model, experienced ham operator.

Many present hams feel that such an experience is missing today. In today's hustle-bustle world, the response to such natural curiosity and desire to learn is, more often than not, "I'm too busy" or "RTFM." As a result, the quality of new hams declines and the knowledge and operating habits they develop in their first formative months and years leave much to be desired. And the very same hams who claim that they "can't understand the new generation" also, in almost the same breath, lament about the "decline of amateur radio."

What is an Elmer today?
++++++++++++++++++++++

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?
++++++++++++++++++++++

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their knowledge to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise. I have set up an administrivia mailbox for this purpose (elmers-request@unomaha.edu, the default Reply-To: of this message).

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO, Educational Services Manager at the American Radio Relay League, 225 Main St., Newington, CT 06111 or via electronic mail addressed to rwhite@arrl.org.

How may I obtain the latest copy of the Elmers List?
++

There are currently 4 ways of obtaining the Elmers List. Any site at least reachable by Internet E-mail can use options 3 or 4:

1. Usenet News: The latest copy of the list can be found in the companion posting to this message, "Amateur Radio Elmers Resource Directory." Since the list is cross-posted to rec.radio.amateur.misc, rec.radio.info, rec.answers, and news.answers on the 1st of each month, with an expiration date 6 weeks into the future, there should always be a copy available at most news sites. Check your newsreader documentation for information about reading previously-read articles.

2. Anonymous FTP: If your site is directly connected to the Internet, you may retrieve the latest copy via File Transfer Protocol (FTP) from the following sites:

ftp.cs.buffalo.edu /pub/ham-radio/elmers*
rtfm.mit.edu /pub/usenet/news.answers/radio/ham-radio/elmers/*

3. Mailing-List: Since the list is cross-posted to rec.radio.info, the latest copy may be obtained from the mailing-list gateway for that newsgroup (along with many other informational articles about radio) when it is published each month. To subscribe, send E-mail to:

listserv@ucsd.edu

and in the BODY (not the Subject) of the message, write:

subscribe radio-info

The server may not be able to determine your return address. In that case write:

subscribe radio-info (your E-mail address)

You should get an acknowledgement very shortly.

4. Mail-Server: If you don't want to read through the entire gateway of rec.radio.info, or want a copy of the list right away, send E-mail to:

mail-server@rtfm.mit.edu

and in the BODY (not the Subject) of the message, write:

send usenet/news.answers/radio/ham-radio/elmers/admin
send usenet/news.answers/radio/ham-radio/elmers/list
send usenet/news.answers/radio/ham-radio/elmers/diff

and the latest copy of the list should be sent to you E-mail within 24 hours (the mail-server uses batch priority to reduce system demand).

How may I contribute to the Elmers List?
++++++++++++++++++++++++++++++++++++++

By using this resource, you are benefitting the net by obtaining assistance in the fastest and most efficient way possible. By volunteering to appear on this list, you are contributing to the good reputation of the radio-related newsgroups.

Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

--
73, Paul W. Schleck, KD3FU

pschleck@unomaha.edu (personal mail)
elmers-request@unomaha.edu (Elmers List administrivia)

* Possible origins of the word HAM:

The acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initials of the founder of the American Radio Relay League, Hiram Maxim, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

Dale Mosby, N7PEX, offers the explanation that HAM must stand for "Hardly Any Money," considering the investment one could make in the hobby.

Knowledgeable individuals from the American Radio Relay League (ARRL), and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

As an interesting historical footnote, early telegraph operators may have been the first to experience the infamous curse of our communications age, Repetitive Stress (or "Carpal Tunnel") Syndrome (called "Glass Arm" in those days, which encouraged the invention of the semi-automatic or "bug" key).

(Larry E. McDonald, N6ZMB, wrote to point out another plausible origin, which doesn't necessarily contradict the ARRL version. The term "ham" may have been derived from "ham-fisted" or "ham-handed" to describe poor telegraph operators who were hired from the ranks of radio operators. Or maybe "ham-fisted" and "ham-handed" are derived from "ham." Who knows?)

1976-1978 FCC Personal Users Radio Advisory Committee
Task force for Rules Rewrite Citizens Radio Service
Rules interpretation

Currently work for Stratus Computers/Technical Support Engineering

Address: Jay_Appell@cac.stratus.com
Telephone: 1-800-458-0042 X2548

I enjoy Amtor, RTTY, and SCA reception.

If you would like to leave me mail by modem, use the BBS 1 Hopedale Center at 508-478-6969. This is a new amateur BBS running from 7AM to 7PM EDST. The board usually runs beyond 9PM daily. Until I can get another server, online times will vary. We honor modems running 9600 baud/MNP 5.

Discussion groups have been setup for all ham radio vendors. Comments shared on this BBS will be conveyed to the ham radio company referenced in the forum. This platform will make companies aware of how the amateur radio community feels about their products. Please indicate otherwise if you don't want the comment forwarded.

Author of the following MS-DOS ham programs:

AutoExam - Examination simulator and study aid
AutoCW - Morse Code practice program
DOSGATE - allows users to run programs on your PC remotely (AutoExam
compatible)
AutoCall - Allows use of the Buckmaster HAMCALL CD-ROM online callbook
with DOSGATE
AutoFax - Allows reception of weather fax using Kantronics TNC's
SeeSats - Real time satellite tracking (text only), DOSGATE compatible

Most of these programs are available from wuarchive.wustl.edu under
/mirrors/msdos/hamradio or write me at:

7 Red Field Circle
Derry, NH 03038

and enclose:

A FORMATTED high density diskette (either 1.44 MB or 1.2 MB; 3.5" or 5.25").
A Self Addressed STAMPED return diskette mailer.
A note explaining that you want a copy of AutoExam and/or AutoCW
(or one of the other programs).

I am always receptive to individuals interested in maintenance,
enhancements, and non-commercial distribution for these shareware
programs.

UUCP: . . . !rwsys!lawton!red!terry
PACKET: WB5LMJ @ WB5MJS.OK.USA.NA
Voice 405 536-8822, Ben's Place (Benjamin Franklin) BBS 536-6988 9p to 6a
PhD candidate, University of Oklahoma in Adult and Higher Education
Educational Advisor, American Radio Relay League
221 SW Crystal Hills Drive, Lawton, Oklahoma 73505

I am primarily an adult educator conducting research in self-directed
learning. I have been involved in the following activities:

- Teach licensing classes, since 1974.
- Organize clubs, Stuttagrt Amateur Radio Club, Panama Canal Astronomy
Club, Lawton Astronomy Club.
- Public speaking and publish on growth in volunteer organizations,
marketing adult and higher education and teaching amateur radio
courses.
- Research in adult learning theory, adult motivation and organizational
theory.
- Conducted a SAREX activity that involve seven communities, 21 schools
and 3,000 children.

I am primarily interested in assisting amateur radio clubs grow.

WA9BVE |

I can help people with HF stuff, cheap antennas, and am willing to help troubleshoot problems with rigs.

I believe that one of the pillars of ham radio - construction/ understanding at the burn-your-hand-with-a-soldering-iron level - is drifting out of ham radio. With Japanese radios which cost so much, fewer and fewer hams are willing to risk their warranty to service their own equipment. I would like to see a turn-around here...

>I have seen.

Both my Standard HT and my Kenwood 741 work this way. The decode in the
Standard came with the radio no extra charge, the decode board for the
Kenwood was $49. It took all of 5 minutes with a screwdriver to install.
Inertia.

> Many of us would have to buy more than a PL decoder. We would need
>to buy a rig with a spot for a PL decoder. It would need provisions
>for controlling that decoder and interfacing with it.

It's getting hard to find a radio that WON'T do this these days...

> Then, when the repeaters are that close, we need some way to prevent
>the squeals and signal blockages when they come up while ours is in
>use, and their repeater output jams our repeater's output.

100 Miles? Close? The Texas VHF-FM Society coordinates co-channel radios
at 85 miles. I think the problem isn't that bad. If you're really having
that much trouble receiving the local radio over one that's 100 miles away,
the local radio is broke.

I'll grant you that PL isn't a catch-all fix. It won't remove the RF signal
from your receiver. If you have enough signal from the local radio to over-
come the signal from 100 miles away, then PL will fix the problem.

The fact is that in today's crowded-band environment, if you put a radio on
anywhere, chances are you'll hear someone else's radio on the same frequency.

Coordination groups fight this all the time. You have to balance the desire
of people wanting more repeaters with protecting those already there.

PACKET TECHCON

THEME
WORLDWIDE NETWORKING ON PACKET

1993 ARRL NATIONAL CONVENTION

Huntsville, Alabama
August 14-15, 1993

* 56k baud...What is it? What does it do for the user?
Coordinated by GRAPES: Doug Drye (KD4NC) and Bruce
Nebergall (K4TQL)

* What is networking? AX.25 vs IP routing...
Coordinated by ALANET: Richard Elling (KB4HB)

* 9600 baud workshop...How you do it!
Coordinated by the Gulf Coast 9600 Baud Group: David
DeBlanc (WB5VMR), Angelo Glorioso (N5UXT), S. Felton
Mitchell (WA4OSR), James Moore (WU3V), and Geoffrey Peacock
(KD4GOE)

* User networking software...Where to get it...How to use
it... Coordinated by ALANET: Jerry Pruett (KD4CIM)

* LINUX...An easy way to get into the UNIX environment...
Coordinated by TENNET: Mark Bailey (N4XHX), Kelly Fulks
(KC4RDJ), and David Wilson (WB5LHO)

* (Possibly more)

VENUE
All forums will be in the same room for two days. A 56k baud
station and 9600 baud stations (5 different type of modems)
will be available for demonstrations and for user interaction.
Each forum will be one hour long. Then, there will be a one
hour break for questions, demonstrations, user operations,
etc.

4506. Questions on DXCC Award

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 12:17:49 UTC
From: rab@hal.cwru.edu
Message-ID: <20ukld$u4@usenet.INS.CWRU.Edu>
Source record: 279727

Recently I received a bunch of QSL cards from the bureau and
(by my count) went over the 100 mark. I submitted them for
field checking for DXCC and was told that cards from the former
Soviet republics can not be field checked. This supposedly is
a change that became effective 1 January 1993.

My cards that fall into this category are

UA4LFR Russia 17-Sep-91
UX1A Russia 16-Feb-92
RC2CB Byelorussia 13-Sep-91
RO4OA Moldavia 11-Jan-92
UF6FAL Georgia 21-Mar-92
RY1I Ukraine 13-Dec-92

Can someone give me the complete story on this?

Also, can someone post the current information on which countries
are field-checkable and which are not? Apparently, the information
in the Fourth Edition of the ARRL Operating Manual is out-of-date
and I'm wondering if my cards from FO0CI, YX0AI, 5U7M, C9RJJ, etc
are now eligible for field checking.

Thanks and 73,
Roger AA8DV

4507. 30M contacts for DXCC

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 12:20:19 UTC
From: MOSIER@steffi.uncg.EDU
Message-ID: <01H00RYVR3QQ8WW12D@IRIS.UNCG.EDU>

>
> Is this true?
>
> I know you can't get a 5BDXCC endorsement on 30. From the rules:
>
> The 5BDXCC is endorsable for these additional bands: 160, 17, 12,
> 6, and 2 meters. 5BDXCC qualifiers are eligible for an
> individually engraved plaque (at a charge of $25.00 US).

True, there is no 5BDXCC endorsement on 30, but 30m contacts *DO* count for DXCC (and for WAC). They do *NOT* count for WAS. I don't know what would happen, though, if you turned in a DXCC application excusively from 30m contacts. When I asked ARRL if they count, they said, "Yes, we wouldn't have any problem if you had several 30m contacts in your application. Does that mean they WOULD have a problem if you had 250?

> Well, your club seems no differnt than the clubs I described.

Ah, now I see. The Williamson County ARC did _lot's_ of things,
not _only_ FD and repeater chatter, but that's not good enough.
You're looking for a club that _never_ discusses FD and/or
repeaters. I suppose DX clubs, but no, most of them use repeaters
or at least packet clusters for spotting, hum ... Antique clubs?
No, it's too much fun using the old rigs at FD.

You could always join a Fishing Club and/or speak for them --
chances are you'd never hear another discussion of FD or
repeaters again.

Other suggestions netters?

:-)

|> Maybe not, but it will solve the problem in this case.
|>

Especially when you take into consideration the fact that Jim said the
repeater is already generating PL. Seems he had anticipated the poroblem
in the first place and it's only the users who have problem livinig with it.

>I just purchased the Alinco DR-1200T, my first radio bigger-than-a-handheld.
>I'm going to need a power supply; but Ham Radio Outlet says their
>"least expensive" would be $109.

That;s about right for a new 12 volt 20 amp power supply.

>Is that ridiculous? (a real question) What should I expect to pay?
>Does anyone have a power supply that they would give/sell to me
>for a lot less?

Radio manufacturers tend to overrate the current requirements for their
radios. I.e. I have a Yeasu 290r (rated at 10a) running on an old
computer power supply rate at 4 amps at 12v. It works fine.

Since the 1200T is a 25 watt transmitter I would expect that an AT class
personal computer power supply (rated 4 amps at 12v continous)
would work fine for packet. Since these supplies can be picked up cheaply at
hamfests, compuer shows, junk bins, etc it's worth a shot.

Before you hook up any power supply to your radio, check it for voltage,
ac ripple and polarity before using. Also note that most 12 volt radios
really want 13.8 volts so they will run slighty under power at 12 volts.

|> Amateur Radio product (the R-4C). This how everyone who's doing
|> *real* passband tuning -- moving a fixed bandwidth around without
|> changing the pitch of received signals -- does it these days.

Well my R-5000 doesn't work exactly that way (using the same oscillator
to mix up and down again). In the R-5000, both the first IF oscillator
and the BFO are synthesized. The IF shift knob is a pot that generates
a voltage that goes to an ADC on the processor board. Operating the
knob causes the processor to simultaneously adjust both oscillators
in step with each other. Thus, it really works more like the old
mechanically coupled systems.

4514. Freebies from ARRL HQ

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 14:41:30 UTC
From: lhurder@arrl.org
Message-ID: <1661@arrl.org>
Source record: 279617

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
-
2. Listings of Amateur Radio clubs in his location.
-
3. Helpful promotional material about the Amateur Radio
Service.
-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
-
To obtain these free ARRL services, please provide me with:
-
A. Your name
B. Your mailing address
C. A Specific request for either the PSCM or the PHP.
-

Interested in the Amateur Radio Service, but don't
know where to turn to locally for assistance?

Well, one of the very best ways to get a local helping
hand is to establish a relationship with your local
Amateur Radio club. And most areas of the country have
more clubs than you'd think possible.

Ah, but the eternal question is always "Say, just how
DO I contact an Amateur Radio club near me?"

Well, folks, do I have a deal for you!

For the price of a message to me here at ARRL HQ,
(SEEMS cheap enough!) and a specific request, I can get
you listings of more clubs than you'd ever want to visit.

To make it happen, please send me a message with your
name, your mailing address, and a specific request for the
Amateur Radio clubs in your area. I'll get them right out
to you.

And for those of you who are already licensed radio
amateurs, remember, your local clubs represent an ENORMOUS
resource for you.

Having trouble with TVI or local ordinances that
affect your capability to serve the public by way of your
Amateur Radio license? Interested in finding someone to
assist with a tower installation? Need to locate a
kindred spirit that understands YOUR concerns about
Amateur Radio satellite operation or digital networking
via Amateur Radio? Chances are that someone in your club
can help.

Another free service, brought to you by the world's
largest support organization for the Amateur Radio Service
-- the American Radio Relay League.

Yet another of the many free services that ARRL HQ offers is the ability to obtain Reciprocol Operating permit information.

Matter of fact, ARRL HQ is the ONLY place on the planet where this information resides!

"Awrite, already" sez you, "why would I ever want one, and how much are ya gonna burn me to GET one?" "Glad you asked!" sez I

Radio amateurs are a constantly-travelling, very mobile, bunch of folks, it appears, and their travels clearly take them to countries near and far. Myself, I prefer "far" rather than 'near', but if you're inclined to travel to Canada, you can ignore this whole tome, as the Canadian government and our own here in the States have worked out an automatic-reciprocity agreement.

But if Belize is on your itinerary perhaps, or any of the other many countries with whom we share a reciprocol operating agreement, you're in luck! Many foreign administrations DO allow U.S. Amateur Radio licensees to apply for a reciprocol operating permit, and you need but ask us for the complimentary package that we make available.

To make your trip more enjoyable in that regard, we need:

1. Your name
2. Your mailing address
3. A specific request for the RECIPOP package for the specific country you'll be off to.

And, yes, an e-mail request is fine!

Hello all,
I need some help. I have the plans for a 2W amp I want to build which
come with a picture of the ciruit and a picture of the PCB layout.
My problem is I don't have enough experience to go from the
circuit to knowing where to place the parts on the PCB! I have
etched the board myself already and have build other kits so I
know I can do it. All I need is the PCB with the parts drawn on
it(in the correct orientation:-)) I'd be more than willing to
trade the plans for just such a diagram if anyone is interested
in a challenge(I had to buy the plans for $10.)
Thanks in Advance

4519. Need Info On HP 612A Signal Generator

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 14:56:59 UTC
From: BMOERS@CORP.QGRAPH.COM
Message-ID: <01H00VLVXTEQ0002SI@NEXUS.QGRAPH.COM>
Source record: 279591

Hey, I know this thing is old, but it does the job! However I recently had to troubleshoot this thing without a schematic, and replaced a handful of leaky tubular caps. The question is what are the two regulated supply voltages produced by this beast supposed to be adjusted to?? (I set them to +235v and -170v)

Also, the output of this 612 is pretty flakey when operated at frequencies below 600 MHz. Do I dare disassemble the cavity assembly in an attempt to resolve this problem?? (assumed to be dirty sliding shorts in the cavity sections)(No, not dirty undershorts)

Thanks in advance for any help on this!

>Thanks in advance.
>Bob N8JDT
>

As far as hardware, I wrote an article that appeared in the Feb 93 issue of QST describing interfaces for Yaesu, Icom, Ten-Tec, and Kenwood. The article includes a bit of background on interfacing also. The biggest problem with the 757 is that it has an oddball Molex type connector on the back. If you have the connector, you are in decent shape.

The interface I describe is buffered and uses a MAX232 chip. Others will say that this is overkill and you can use simpler methods. I agree - especially in this case. The 757 does not send data to the computer, it is a one-way connection from PC to the rig. Perhaps someone else will describe one of the simpler methods (i.e. a diode).

PD software is on a lot of BBSs. Try N8EMR's BBS (can't remember number but it is posted here periodically).

[Reposted to rec.radio.amateur.misc because of lack of response on]
[rec.radio.amateur.equipment. If you have already read this please]
[excuse. Thanks.]

Hi there. I have a Heath HW-24, a dual-band mobile rig, that I picked up at a ham fest two weekends ago. I would like to know how to do the out-band-receive mod on this rig. I have tried a couple of sites and the mod server with no luck. If you can help me out I would really appreciate it. Thanks in advance.

Thomas James, KD4APZ

PS If you know of any more mods or features not documented in the manual for this rig I would appreciate them too.

>Is that how it works or did I miss one?

I think somebody at your Post Office, and somebody at mine, too, must be a ham. I received the May and June issues of QST, but although the library here got its copy of the July issue of QST a week or two ago, I still have not received my copy. If it eventually arrives with soup stains on several of the pages from being read at lunch breaks, I'll have a pretty good idea of why it was late.

Message-ID: <m35v7gINNjju@news.bbn.com>
Source record: 279592

tcline@hplvec.LVLD.HP.COM (Ted Cline) writes:

20 meters (SSB) was very good for us as well at N1NH. We had
excellent reports from the northwest and the southwest, which the 4
element monobander at 70 feet pointed south of west had a lot to do
with. This was my second field day (last year was at the novice/tech
station) and I had a blast. Sharing the duties with an experienced
operator was most educational; I may have tripled the number of phone
contacts I could complete in an interval of time. And it was fun
being on the other side of the pile-ups ("station with Oscar Yankee
stand by; Alpha Charlie Six, copy fifteen-Alpha New Hampshire, qsl?").
We wound up with almost 1300 contacts on 20ssb.

Except for some ground-wave stuff we got few contacts in New England,
hardly any in 2-land or 3-land except Pennsylvania. We got just about
every other section further out, including PAC and MAR.

|Last year our Novice/Technician station (N0RQV) made 85 contacts on 10
|meter phone while the band was open.

|This year our Novice/Technician station (N0RQV) made 672 contacts on 10
|meter phone. The band was open from 12 noon until about 9:30PM MDT and
|again from 10:45AM to 12 noon MDT. We ran about 90 watts USB and we
|couldn't talk fast enough.

We broke our own records in the N/T station too (N1NYT). It was
clearly sporadic-E, judging by the regions to which openings came and
went; something like 347 contacts, almost all 10m SSB. The station
was running 100 watts (I think) into a monobander about 40 feet up.

Conway Yee writes:
> I have a question regarding the FCC regulations concerning closed
> autopatches.

Repeaters and autopatches are private property, owned
and operated by individuals or groups. You cannot compel
or require them to allow you to use their equipment. Also,
they get to set the rules for use, including providing a license
copy, or standing on your head and whistling Dixie if that's
what they want. You, of course, get to choose whether or
not you want to play along; you chose not to, and that's ok.
But you shouldn't get grumpy about not being able to use
their repeater station. Note that the *frequencies* involved
belong to everyone; repeater coordination is strictly voluntary.
You are technically free to use the input and output frequencies
for your own purposes, subject to the regulations and customs about
interference. If you want to make the rules, then set up your
own repeater. But if you want to use someone *else's* repeater,
then you should expect to have to follow their rules.

There will be a "Weekend" DXpedition to OJ0, MARKET REEF on July 9th
through July 12th. We will be active in both the IARU Contest and
the CQ WW WPX VHF Contest. THe following is some general information:

Dates: July 9th-12th
Modes: CW/SSB and AO-13 Satelllites
Bands: ALL BANDS 160-6 plus Satellites (WARC BANDS ALSO)
Frequencies: Regular DX Frequencies

Operators: Seppo OH1VR
Jukka OH6LI
Javier AH6MM

CALLSIGN IN BOTH IARU AND CQ WW WPX VHF CONTEST:
"OJ0/OH1VR"

BEFORE and AFTER the IARU and the CQ WW WPX VHF CONETESTS the following
calls will be used on the respective band:
BANDS CALLSIGN
AO-13, 6, 30 and 80 meters------------------------------>> OJ0/OH1VR

40, 15 and 10 meters------------------------------------>> OJ0/OH6LI

20, 17 and 12 meters------------------------------------>> OJ0/AH6MM

QSL INFORMATION:

OJ0/OH1VR ----------->> DIRECT or Via OH Buro

OJ0/OH6LI------------>> DIRECT or Via OH Buro

OJ0/AH6MM------------>> VIA WA6IET (Via W6 Buro ok)
Bill Shell
260 Mesa Road
Nipomo, CA 93444

ALL OH8/AH6MM QSL's can go to KJ6BK

We will be signing as OH0MMM on ALAND ISLAND for a few hours. QSL VIA
OH1VR.

73 and we hope to work you in the contest..

Javier OH8/AH6MM

The Yaesu FT-5100 and FT-5200 also do this. The scan slows down a bit while the CTCSS decode occurs, but the squelch doesn't open unless the correct tone is present. The optional CTCSS board is required. (I'd never buy a radio without CTCSS decode -- sooner or later the manufacturers will figure this out and start making it a standard option!)

4545. Waiting for a License? Don't Call the FCC!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 17:23:38 UTC
From: perry@fc.hp.com
Message-ID: <C9HxnE.EKD@fc.hp.com>
Source record: 279621

I just received the ARRL VE Express Newsletter. Apparently, the FCC is becoming annoyed at the number of hams that are calling to check on the status of their license application.

The FCC's policy is to have licenses applications processed within 90 days. If it hasn't been 13 weeks, DON'T CALL THE FCC! Your call diverts them from their real task - processing the applications.

I can sympathize with those that are waiting. I had to wait for my Tech license several years ago and it seemed to take forever - a whole 8 weeks.

4546. Re: Ground Rods In Concrete

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-01 17:31:08 UTC
From: babb@rapnet.sanders.lockheed.com
Message-ID: <1993Jul1.173108.4309@Rapnet.Sanders.Lockheed.Com>
Source record: 279625

It seems that all of the examples offered have one thing in common:

The object which was struck by lightning was not well grounded.

A ground rod which terminates in a concrete pad is *NOT* a good ground. The resistance between the concrete and the actual earth is too high. A cadwelded frame of rebar (1"+ diameter) with connections extending outside the concrete (into the surrounding earth) for several feet will provide a decent ground, assuming that you have "normal" soil.

Had these objects been well grounded, I suspect that they would have bled off the static potential as corona (or something) and never have developed the potential difference needed to become good lightning targets. Even the tower with the multiple ground rods was set up on insulators, thereby allowing it to develop a significant static charge. It doesn't matter whether it's an up-strike or a down-strike, the electrons still travel.

Many people think that lightning rods are supposed to take lightning hits and shunt them to ground. That's not how they work. Lightning rods bleed off the static charges around the objects that they protect, keeping those objects from becoming good targets for a lightning strike.

The Louisian Council of Amateur Radio Clubs Repeater Coordination
Committee thought of this and divided the stat into 5 zones based on
major population centers and assigned a unique tone frequency to
each area(New Orleans is 114.8 Hz). Repeater owners are encouraged
to use this tone if the repeater is placed on tone access to reduce
interference. That way you only need one tone (unless you go on the
road).

CY> The only reason was the lack of a photocopy of my license. They also
CY> invited my to resubmit my application with the "required" photocopy
CY> and that if I thought the requirement was unjust that it have to be
CY> fought as a member of the club.

CY> Since there is no need for them to have a copy of my license on file,
CY> I feel that the requirement is unjust and I refused to submit it.

So why don't you not use there autopatch. Seems to me that the requirement is a good one, it sorts out a person who doesn't want to be part of the group. If your question on autopatches is can you use there's anyway. Well the answer is quite easy -- no.

Why don't you make a photocopy and join the club.

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 118
BID: $OPDX.118
July 5, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, K4CEF & Southeastern Cluster Group, DJ5JH, DJ0WQ, G0GWA, Z32GX, KN4F, AH6MM, KQ8M and WB9OTX for the following DX information.

3V, TUNISIA. The planned trip to Djerba Island by Paul, I1RBJ, has been cancelled. Reportedly, he had operating permission, but the authorities refused to let him bring his equipment into the country.

5A, LIBYA. The latest word on Romeo and the 5A operation is that there "IS NO WORD". Ed, NT2X, reported on W2MIG's net that he has not received any information from Romeo since he talked to him twice on June 24. Ed believes that Romeo is still in Libya, and if he were somewhere else that he (Romeo) would have called him. So there is no further information on 5A0RR available at this time other than that there was one spot this week reported on the Ohio/Penn DX Network by a W2 station on June 30th, on 14009 kHz at 0451z.
There has also been several reports of activity by 5A0/DJ6RA on 20 meters CW at various times, stating to QSL via DL7FT. The majority feel this is an operation by SLIM, but WFWL and hold on to your green stamps until we hear something.

5H, TANZANIA. Simon, G0GWA, reports he will be in 5H-land for 3 months starting around July 4th. He hopes to be active on the HF bands, but mostly on CW. He does not know what call sign he will be issued until he gets there, but it may be 5H3FE (possibily FOE) in Dar-es-Salaam, which is the call sign of the university engineering faculty station. QSL via CBA or bureau. Cards will not be answered until about October after his return.

7Z, SAUDI ARABIA. Look for more activity including contesting from 7Z1AB in the next two years. Alan, KD4MAE (ex. KA9DOO, TU4BR, TU4BR/5U, EL7FO), will leave in mid-July for the embassy. He will share the call sign with the embassy, but will set up his own station at home and operate from there. He is taking an Icom 740, KW Amp, a new Mosley PRO67A beam, and an Icom 551D (for 6 meters). KN4F will assume QSL Manager duties shortly.

BV9P, PRATAS ISLAND (UPDATE). It has been reported that the trip to Pratas Island will be delayed until at least the 15th of July. It seems that the plane that flies there once every 10 days had to scrub its flight due to a storm. Operators are now spending time assembling their equipment and waiting for the next flight. Everything looks like a go until then.

OH0, ALAND ISLAND (UPDATED). The operators from OJ0 DXpedition (see OJ0) will be active here on July 9th and July 12th. During their short stay, all operators will be using OH0MMM. QSL via OH1VR.

OJ0, MARKET REEF (UPDATED). This DXpedition will take place July 9-12 and is being called, "The Weekend Trip to the Rock". Operators AH6MM, OH1VR and OH6LI will be active in the IARU Contest and CQ WW WPX VHF Contest as OJ0/OH1VR. Activity during their weekend stay will be on CW/SSB, AO-13 Satellite, 80-6 meters and 2-70cm meters. Outside the contest, the following callsigns will be used on the corresponding bands:
OJ0/OH1VR - Satellites, 6 meters, 30 meters and 80 meters
OJ0/OH6LI - 10 meters, 15 meters and 40 meters
OJ0/AH6MM - 20 meters, 17 meters and 12 meters
"EXPECTED" AO-13 openings: Japan - July 9th 2300z thru July 10th 0100z, North America/Europe - July 11th 1230-1500z and Europe/Partial North America - July 11th 2000z. QSL information: OJ0/OH1VR - Direct or via bureau, OJ0/OH6LI - via OH Bureau or Jukka Klemola, Harmantie #43, 62300 HARMA, FINLAND (CBA maybe wrong) and OJ0/AH6MM - via WA6IET (W6 Bureau OK) Bill Shell, 260 Nipomo Mesa Road, Nipomo, CA 93444 (QSL's for all other "OH*/" operations by AH6MM should be sent to KJ6BK.)

TY, BENIN. We do not have much information on this one, but ST0DX/TY was reported active on the 14247 DX net around 2300z. (Send reports!)

V5, NAMIBIA. Roland, DJ4LK, will operate sporadically as V51LK, starting July 5th before his trip to Penguin Island (see ZS9 & ZS0).

ZF, CAYMAN ISLANDS. Jack, WB9OTX, will be active until July 10th, as ZF2GO. His activities (bands and modes) were not mentioned. QSL via Jack Demaree, P.O.Box 69, Versailles, In 47042-0069.

ZS8, MARION ISLAND. It seems Christy has become quite active in the U.S. phone band now. This past week he was active on 14195 kHz going by call areas. Check around 1330-1430z (longpath for stateside).

ZS9 & ZS0, WALVIS BAY AND PENGUIN ISLAND (Correction and Updated). Operators DK2WH, DK4LK, DJ2ZS and DJ0WQ will be active from Penguin Island (IOTA AF-055) from July 28th thru August 4th, as ZS0PI. Then after the ZS0PI operation, both DJ2ZS and DJ0WQ will be active from Walvis Bay (ZS9) until August 28th. Activity will be on CW/SSB and RTTY. They will have two stations equipped with amps, beams, verticals and long wire antennas. Frequency plan (conditions permitting):
CW - 1829, 3508, 7008, 10101, 14025, 18070, 21025, 24900, 28025
SSB - 1835/1841, 3790, 7070, 14190, 18130, 21290, 24940, 28490

QSL INFORMATION. The following stations are from the Republic of Macedonia and are members of "Macedonia DX Group".
Z37GBC via YU5GBC, Radio club N. Tesla, P.O.Box 71,

Does anyone know of or where I might obtain modification information concerning the Alinco Dj-120T handheld 2m transceiver? I am curious to find out any information concerning the radio. I would love to enable a direct keypad frequency entry mod or other mod.

Any assistance would be appreciated.

The point of the matter is that PL decode isn't really necessary on that rig, or any other mobile or HT for that matter. As for the lack of DTMF decode... the FT-5100 has it and alot more memories. A better radio in my opinion, but if you bought the 5200 because of the detachable face, well... good luck with it and hope you enjoy it. You got rooked.

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction to the FAQ and Amateur Radio
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

The FAQ cannot always prevent people from posting repetitive questions. But
even if hundreds of questions get posted, it saves you from having to answer
them hundreds of times. Also, a friendly pointer to the FAQ in your first
answer can help that person refer to the FAQ in the future. That is when we
can begin to get a real savings of network bandwidth.

To reduce the size of each article, the FAQ information is posted in 3 parts:
Part 1 - Introduction to the FAQ and Amateur Radio
Part 2 - Amateur Radio Organizations, Services, and Information Sources
Part 3 - Amateur Radio Advanced and Technical Questions

Table of Contents

* How to Contribute to the FAQ Articles (6/93)
* Acknowledgements (6/93)
* Notes on "Netiquette" (1/93)
```

** What is Amateur Radio? (11/92)
** Who can become a ham? (6/93)
** Where can I locate information and books on Amateur Radio? (4/92)
** How much does it cost? (4/92)
** Where can I take the tests? (pre-4/92)
** What are the tests like? (6/93)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (11/92)
** Should I build my own equipment or antenna? (11/92)

Part 2 - Amateur Radio Organizations, Services, and Information Sources
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (6/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (6/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(6/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another

country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (6/93)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** Introduction to the FAQ

* How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please
consider the following criteria:
- is it a commonly asked question?
- will its inclusion help reduce the usage of network bandwidth?
- how useful is it to beginning Hams or to the majority of Hams?
Contributions don't have to meet all of these but the minimum is one.
We actually only ask that you consider these before contributing.

We can't necessarily include every question or every topic - the
network simply doesn't have enough bandwidth to carry that much
information. Besides, the point is that we're trying to conserve
network bandwidth. You can find the locations of much more informa-
tion by referring to the "Index to the rec.radio.amateur.* Supple-
mental Archives" posted monthly by Paul Schleck KD3FU.

If you suggest a question for this FAQ, please include the answer.
You'll get credit for your contribution and you'll speed up the pro-
cess of getting the information ready for distribution.

If you feel your contribution is sufficient to meet the considerations
shown above, send it to hamradio-faq@amdahl.com so that it will
reach all the FAQ coordinators: (listed in alphabetical order)

Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)

* Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Carlson KC1SP's work or her editing of a contributor's work. Diana established this FAQ and credit is due to her for founding this project.

Thanks to Devon Bowen KA2NRC for accepting this FAQ in e-mail every month to keep the FTP archive at ftp.cs.buffalo.edu up-to-date.

* Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* If you are new to UseNet, the introductory articles in news.announce.newusers are required reading. Go to that newsgroup now. Definitely, read the instructions there before posting anything. Other rec.radio.amateur.* readers will appreciate it!
* Pick the right newsgroup. Use only the most specific newsgroup for your subject. For example, a question about a homebrew antenna only needs to be posted to rec.radio.amateur.antenna. Also, don't post to rec.radio.amateur.misc when the subject can go in another rec.radio.amateur.* newsgroup.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the newsgroup. Instead, just send an e-mail message

which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* Software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aims are public service, technical training and experimentation, and communication between private persons. Amateur Radio operators are commonly called hams. Hams often communicate with each other recreationally but also provide communications for others at public events or in times of emergency or disaster.

** Who can become a ham?
The answer to this question differs in every country.

The answer for the USA is listed below. If your country has a newsgroup specifically for it (i.e. UK, Australia, Germany) the most accurate answers can be found there. See Part 2 for the list of region-specific newsgroups.

If that doesn't help, the American Radio Relay League (ARRL) may be able to help because they communicate with similar organizations in other countries, probably including yours. They can be reached by electronic mail or surface mail (see Part 2.)

In the USA, anyone who is not a representative of a foreign government can be an Amateur Radio operator. There are tests that you must pass to get a license, however the tests are not insurmountable. On that general level, the requirements are probably similar in almost every country.

For more information on becoming a Ham in the USA, the ARRL has a toll-free number where you can request information: 1-800-32-NEW-HAM (don't worry about the number being one digit too long - the phone system ignores it.) Other information

can also be obtained from the ARRL e-mail information server, detailed in Part 2.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications.

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1993); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).

* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Participate in transmitter hunt games and maybe build your own direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. A list of UseNet Elmers and their e-mail addresses is posted to the newsgroup monthly. If anyone wants to be an Elmer, send e-mail to
elmers-request@unomaha.edu

** Should I build my own equipment or antenna?
[see also rec.radio.amateur.homebrew and rec.radio.amateur.antenna]
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

Antennas can be much simpler projects than the transceiver, though some types are also quite involved. Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

When building or even understanding antennas, it is good to know the relationship between the antenna element length and the frequency or wavelength it is designed for. An antenna performs best at multiples of 1/4 of that wavelength, though 5/8 wave also has beneficial qualities. The wavelength is related to the frequency with the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

You do not need a huge antenna or tower like ones you may see around your neighborhood. Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

If you can afford new rigs and antennas, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

4559. rec.radio.amateur.misc Frequently Asked Questions (Part 2 of 3)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 09:43:08 UTC
From: ikluft@uts.amdahl.com
Message-ID: <ham-radio-faq-2-742038183@uts.amdahl.com>

Revision: 3.13 06/21/93 13:51:29

Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
------------------------------------------------------------------------------

Questions discussed in Part 2: (dates indicate last modification)
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (6/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (6/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--

** Where can I find Ham Radio information with a computer?
This question has many answers spanning several electronic media
including UseNet, electronic mail, the Internet, dialup bulletin board
systems (BBS) and others. Various electronic information sources are
summarized under the subheadings that follow.
```

All electronic mail addresses listed are in Internet format. If your site is not connected to the Internet and does not support Internet-style mail addresses, you will need to contact either your system administrators or a local "guru" to find out how or if you can send mail to the sites listed. Ask them, "how can I get mail to the Internet?" and show them the address you're interested in.

* The rec.radio.* newsgroups
The primary distribution mechanism for this FAQ is UseNet. There are several newsgroups dealing with Amateur Radio and other aspects of radio. The full list is as follows:

rec.radio.amateur.misc (*) Ham Radio - misc/general topics
rec.radio.amateur.antenna Ham Radio - antenna construction/theory
rec.radio.amateur.equipment Ham Radio - manufactured equipment/mods
rec.radio.amateur.digital.misc Ham Radio - digital radio modes: packet/AMTOR/RTTY/etc (formerly r.r.a.packet)
rec.radio.amateur.homebrew Ham Radio - radio experimentation, kits
rec.radio.amateur.policy Ham Radio - policy & regulation
rec.radio.amateur.space Ham Radio - satellites, EME, shuttle/MIR
rec.radio.broadcasting public broadcast radio
rec.radio.cb Citizens' Band Radio
rec.radio.info (*) periodic info from all rec.radio groups
rec.radio.noncomm misc non-commercial radio topics
rec.radio.shortwave Shortwave Radio
rec.radio.swap radio equipment wanted and for sale

Country- or region-specific newsgroups include the following:
aus.radio Australia (misc radio topics)
aus.radio.amsat Australia (amateur satellites)
aus.radio.packet Australia (packet radio)
de.comm.ham Deutschland/Germany
fj.comm.ham Japan
uk.radio.amateur United Kingdom
in.ham-radio USA, Indiana
sbay.hams USA, CA, South Bay Area/Silicon Valley
triangle.radio USA, NC, Research Triangle area

This FAQ is cross-posted to the newsgroups marked with asterisks (*). It is also cross-posted to rec.answers (the archive for FAQs in the rec.* newsgroups) and to news.answers (UseNet's general repository for FAQs.) These should be the first places to look for new current copies of the FAQ.

Most of the rec.radio newsgroups have their own FAQs as well.

* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting Amateur Radio in the USA. They have established an automated file server which responds to information requests via electronic mail. To use the server, send mail to info@arrl.org with any number of one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be
appended to your message

The server program will respond to the commands, each in a separate message. Among many other informative files, a current copy of the FAQ (updated monthly) can be obtained from the ARRL e-mail server.

* The Internet File Transfer Protocol (FTP)
Sites connected to the Internet can access large amounts of data almost anywhere in the world, often at high speeds. One common way to transfer the data you want is FTP. Some sites offer a service called "anonymous FTP" which allows remote users to access a set of public files without requiring a password.

Tom Czarnik coordinates a fairly definitive list of anonymous FTP sites, their IP numbers, time zones, general contents, and access policies which he posts to the comp.misc, comp.sources.wanted, alt.sources.wanted, and news.answers newsgroups. It is itself available via anonymous FTP (how about that?? :-) from (among other places) rtfm.mit.edu (18.172.1.27) under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name, the Archie database server may be of help. First check if anyone has installed the "archie" program on your machine and use it. Archie may also be accessed by telnetting to one of the following sites (use the one closest to you):

Finland/Europe: archie.funet.fi (128.215.6.102)
Canada: archie.mcgill.ca (132.206.2.3)
Australia/New Zealand: archie.au (128.184.1.4)
Israel: cs.huji.ac.il (132.65.6.5)
UK/Ireland: raquel.doc.ic.ac.uk (146.169.11.3)
USA (Maryland): archie.sura.net (128.167.254.179)
USA (Nebraska): archie.unl.edu (129.93.1.14)
USA (New York): archie.ans.net (147.225.1.2)
USA (New Jersey): archie.rutgers.edu (128.6.18.15)

Login is archie. Type "help" at the prompt for a description of all server commands.

For those without telnet capability, the database may be accessed non-interactively via mail server. Send E-mail with the word "help" to archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are extremely powerful tools for finding out "what's out there" at various FTP sites around the world. *PLEASE* exhaust their capabilities before posting requests to the net.

The following is a brief summary of major ham-related FTP sites and
places where you can obtain a current copy of this FAQ:

ftp.cs.buffalo.edu (128.205.32.9)
(submissions to this ftp site should be made to
bowen@cs.buffalo.edu) - contains many ham radio files,
including the FAQs, Elmer list, SWL and scanner info, Packet
FAQ, examination opportunities, information on various
regulations, information on commercial radios (i.e. GE or
Motorola), SSTV (slow-scan TV), HTs (handheld transceivers)
and the KA2UGQ worldwide BBS list. See ~pub/ham-radio. This
FAQ is updated monthly here.
grivel.une.edu.au (129.180.4.7)
This site contains a mirror of ftp.cs.buffalo.edu's Ham Radio
archives. It provides a shorter distance if you're in
Australia or if Australia is a shorter net.path for you than
New York.
nic.funet.fi (128.214.6.100)
This is one of the largest FTP sites in Europe and maybe the
most popular. There are many directories of Ham-related files
in /pub/ham. /pub/ham/info contains a mirror of Buffalo.
Other topics available here include amiga, antenna, HF, packet,
satellite, scanners, program sources, VHF and others.
ftp.uu.net (137.39.1.9)
A large FTP site in the USA - UUNET contains sources and
binaries for many different types of computers.
wsmr-simtel20.army.mil (192.88.110.20)
Keith Peterson, W8SDZ, has apparently returned as the
maintainer of this huge repository of ham-radio (software and
modifications), MS-DOS, and CP/M files. To find out how
to submit files to this archive, please read his informational
posts to the comp.binaries.ibm.pc.archives newsgroup. If you
cannot directly FTP from wsmr-simtel20, there is a mail server
that can help. Send mail with the text "help" to
listserv@vm.ecs.rpi.edu (128.113.5.11).
wuarchive.wustl.edu (128.252.135.4)
A "mirror" of the files available on Simtel20, plus a *LOT*
more. A more user-friendly Unix environment (plus a faster
net connection) makes this site preferred over Simtel20.
If you are on a Unix box locally, see if your system
administrator will "NFS-mount" these files for faster/easier
access.
ucsd.edu (128.54.16.1)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
Radio-Info and TCP-Group digests.
uxc.cso.uiuc.edu (128.174.5.50)
cd pub/ham-radio - This site contains the HyperCard Hamstacks
written by Diana Carlson as well as ASCII readable ham radio

question pools.
ftp.apple.com (130.43.2.3)
cd pub/ham-radio - Ham software and information, especially
Macintosh software
wolfen.cc.uow.edu.au (130.130.68.4)
athene.uni-paderborn.de (131.234.2.32)
ham radio files and software for the Amiga computer system
rtfm.mit.edu (18.70.0.226)
cd pub/usenet/news.answers - all participating FAQs and
periodic informational postings are archived here, including
those from the rec.radio.* newsgroups which can be found in
pub/usenet/news.answers/radio. Participating FAQs are
automatically archived here when they are posted on UseNet.
ftp.amdahl.com (129.212.11.1) also called charon.amdahl.com
cd pub/radio/amateur - the most up-to-date copy of the FAQ
(updated nightly when changes are made)

If you experience difficulty connecting to the above FTP sites, some
troubleshooting hints are shown below. The unfortunate situation here
is that Netnews is far more prevalent than direct Internet hookups,
accurate name servers, smart mailers and routers, and of course,
telnet and FTP client services. What this means is that your trouble
may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line
and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If
this is the case, then you have no direct connection to the Internet
and thus cannot use real-time interactive services like FTP and
telnet.
* If you are at a college or university, your host (ie, the computer
you are logged onto) may be on the Bitnet network, which has an
email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host
have telnet and/or FTP client programs? (ie, if you type "ftp" or
"telnet" at your command prompt, do you get anything?) Many hosts,
particularly IBM mainframes not running Unix, do not support these
services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to
misconfigured connections and inaccurate host tables/name servers
(*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar
error, try telnetting via the IP number, a set of four 1-3-digit
numbers separated by periods (eg, 137.48.1.1). The exact IP number
for the site can be obtained via the nslookup utility, if your
computer supports it....or check the FAQs. Your host may not
recognize the "fully-qualified domain name" (like
callsign.cs.buffalo.edu), but it should ALWAYS recognize an IP
number if their network is reachable from yours.
* If you get "network unreachable" check with some more knowledgeable

users if your site is actually connected to the Internet. If it is,
a link in the network may be temporarily disconnected for maintenance
(or by accident.)
* In the case of telnetting to a non-default port (as in the case
with the callbook servers), if telnet <host> <port#> doesn't work,
but you can telnet to the default login port (ie, no qualifiers),
then the manner at which the port qualifier is entered may be
system dependent.
* Syntax for telnetting from different operating systems differ.
Some common command syntaxes are: (angle brackets are for
readability, do not type these in literally)
Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>
telnet <host>/<port#>
telnet <host>/port=<port#> (for Multinet on VMS)
* Compression techniques are different for different operating systems.
However, these hints should help:
foo.sit needs Macintosh UnStuffit to unstuff
foo.hqx needs Macintosh BinHex to uncompress
foo.tar needs Unix or GNU tar utility to extract archived files
foo.Z needs Unix 'uncompress' to uncompress or VMS
compress_vms.exe (on gatekeeper.dec.com) will work too.
foo.z needs the GNU gzip utility (from prep.ai.mit.edu) to
uncompress it. gzip will also uncompress *.Z files.
If more than one method was used,
like for foo.hqx.Z, start at the outside and work in (so uncompress
on Unix with 'uncompress' first, transfer to MacIntosh, then
uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software
regularly posted to comp.binaries.ibm.pc and news.answers.
* If all else fails, ASK your system administrator or check system
documentation.

* Access to FTP archives via electronic mail
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for anything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. The Archie database server may also be useful to search
for files and their directory locations on FTP sites around the world
(see below). Please be patient when using non-interactive mail
servers such as BITFTP as each request may take several hours (or
longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:

FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY
<mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS,
COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>,
QUIT, HELP. Get the help file for more information by sending mail
with the single line "help". The ftpmail site may complain if you try
try to get more than 1 file per email request. Here is an example of
a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP
mailservers, like FTPMAIL, please be considerate of any systems that
your mail must pass through. The quickest way to find yourself cut
off from the world is to make the admins of sites that pass your mail
pass 60Mb of X11 graphics system source. If you need large amounts
of information from a mailserver, contact your admin for help -- it
may already be available, or he may know a better way to get it.

* The Info-Hams mail list: rec.radio.amateur.misc by mail
You can use rec.radio.amateur.misc even if your site has no NetNews
feed. To subscribe to rec.radio.amateur.misc, send email to:
Info-Hams-Request@ucsd.edu
In the body of the message, write:
subscribe Info-Hams
If your local e-mail software does not provide a valid return address
(i.e. Bitnet, many Milnet sites, and many non-Unix e-mail packages)
you can provide your return address between the "subscribe" and the
name of the mailing list (i.e. "subscribe myname@here.org Info-Hams".)

Similarly, to subscribe to some other rec.radio.* newsgroups, use
the following directions:
* To subscribe to rec.radio.amateur.packet, send email to
Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio"
* To subscribe to rec.radio.amateur.policy, send email to
Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy"
* To subscribe to rec.radio.info, send email to

Radio-Info-Request@ucsd.edu, message is "subscribe Radio-Info"
* To subscribe to rec.radio.shortwave, send email to
listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)"

TO UNSUBSCRIBE, follow directions above, changing the command word
"subscribe" to "unsubscribe"
DON'T POST TO THE NEWSGROUP ITSELF! USE THE REQUEST ADDRESS!
Help is available by using the command word "help". Note that command
words MUST be the first word on each line of the message.

You can post to rec.radio.amateur.{misc,packet,policy} by sending
your posting email to Info-Hams, Packet-Radio, or Ham-Policy, all at
ucsd.edu. Since rec.radio.info is a moderated newsgroup, requests
to post to it may be sent to Radio-Info but they will be mailed to
the moderator, rec-radio-info@ve6mgs.ampr.ab.ca, for posting.

All of the Amateur radio newsgroups are archived for FTP on ucsd.edu
under subdirectory mailarchives/{Ham-Policy, Info-Hams,Packet-Radio}.
Radio-Info is not archived at UCSD. (See the news.answers archives
at rtfm.mit.edu.)

* Telephone BBS's with Ham-related information
WB3FFV has one, phones are 301-625-0817 or 301-625-9482 or
301-625-9663. Data settings are 8 bits, NO parity, 1 stop bit.
Login is bbs, no password.
This BBS is also available via UUCP, login is uucpanon, no password.
For a listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings
are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of
other ham-related BBS's on-line.

* Callsign servers and geographical name servers
If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10)

There is also a general geographical name server at:

martini.eecs.umich.edu (currently 141.212.100.9)

The callbook servers sit on port number 2000 and the geographical
name server sits on port 3000. These are different port numbers
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 or 3000 instead of
the default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, check the telnet/FTP troubleshooting hints above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

There is another email callsign server at callbook@n8emr.cmhnet.org. The subject line is the list of callsigns to lookup. All other lines are ignored. This same callsign server can be accessed with packet radio via cbook@n8jyv.#cmh.oh.usa.na. The body of the message should include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS, and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..." (where call1 call2 .... is space separated list of callsigns you want to lookup).

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. For Canadian calls, use the callserver at REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

The REQQTH address is for the AX.25 radio-linked amateur packet network, *NOT* the Internet. If you attempt to send Internet mail to this address, and use the old .NA suffix instead of the new .NOAM suffix, it will get routed to Nimibia (Internet suffix .na) which is currently paying a lot of money for misdirected ham mail. Help maintain a positive example for amateur radio and please do not attempt this!

The FCC "call sign hotline" at 717-337-1212 is available for those
who wish to listen to the call signs allocated in each group for each
district. This requires only a touch-tone telephone to use.

* FTP access to FCC Part 97 and FCC Amateur Radio question pools
Part 97 is part of the FCC regulations and only applies to the USA.

The text to part 97 is available by ftp from several locations:
Western US
ftp.amdahl.com /pub/radio/amateur/part97.txt.Z
Central US
pacific.mps.ohio-state.edu /msdos/ham/part97.arc
Eastern US
gandalf.umcs.maine.edu /pub/ham-radio/part97.txt
ftp.uu.net /networking/ka9q/part97.arc
The *.arc files are MSDOS ARC files with the same ASCII text.

An ASCII copy of the question pools are available by ftp from
uxc.cso.uiuc.edu (128.174.5.50) in /pub/ham-radio/<class>-pool.txt.Z,
where <class> is novice, technician, general, advanced or extra.

* Lists of radio modifications and extensions
[see also rec.radio.amateur.equipment]
Some mods can be found on wsmr-simtel20.army.mil or
the Simtel20 mirror directories on wuarchive.wustl.edu.

There is a new server at pcserver@novell.business.uwo.ca. Some
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

There is a packet radio Mods Server. To get the directories, send
a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and
that these mods are NOT guaranteed to work. This list is supplied
here because it is sometimes a frequent question on the newsgroup.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail
addresses are available from the ARRL e-mail file server in the
file called "email". See above for more information on the ARRL
e-mail server.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a concerned member (or, actually, any concerned Ham) carries a lot more weight than hearsay from any source. Their e-mail addresses are available from the ARRL e-mail file server (see above). They want direct input - that's why those addresses are available.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones (this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY 11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449, FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet 70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655. Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815, (800) 365-SUBS - lots of special interest columns, like QRP, ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 - up-to-date information on Amateur Radio happenings, including VE information and statistics

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip; do NOT affix extra postage to envelope. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST and on the ARRL e-mail server (see below); if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

Addresses for the US incoming and outgoing QSL Bureaus are available
from the ARRL e-mail server in the files called "qsl-in" and "qsl-out".
See the question above

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However,
rec.aviation.misc is appropriate for CAP aviation discussions and for
CAP radio information, these rec.radio.amateur.* groups are available.
CAP-related files are also stored on the FTP site
sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter
band. It was first conceived when propagation was poor on 10 meters,
as a method to get more hams to use 10 meters. The past few years
have been great for 10 meters worldwide. However, "the bands are
closing down" again, and 10 meters will once again be limited more
for local communications, except for sporadic band openings, until
the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call
sign, operator's name and location. Send the list to your numeric
call sign or DX area manager (as shown below), with $5.00 U.S. new
membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N3FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent
required under age 17), be a US citizen or resident alien, possess a
valid Amateur Radio license, possess a station capable of operating
on MARS HF frequencies, and be able to operate the minimum amount
of time for each quarter (12 hours for Army and Air Force; 18 hours
for Navy-Marines). Novices must upgrade to Technician within 6

months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
HQ AFC4A/SYXR
203 W. Losey St. Room 1020
Scott AFB, IL 62225-5219
(618)256-5552 Fax: (618) 256-5126

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency. The Radio Amateur Civil Emergency Service is a part of a municipal, county, or state government. This does not mean, however, that every such government has a RACES program. If your government does not have a RACES, ask them to refer you to the nearest jurisdiction that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it thru 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try the "Radio Amateurs on Usenet" listings, maintained and posted by Mark Salyzyn VE6MGS. The articles can be found monthly on rec.radio.info and rec.radio.amateur.misc. If the copy in your news spool has expired for some reason, you can look up an entry in the list by sending an e-mail to reqnet@ve6mgs.ampr.ab.ca with either of the following commands in the body of the message:
lookup keyword keyword keyword ...
return user@machine.subdomain.domain
(Fill in the proper info for the search keyword or e-mail address.)
An automated server program will reply to your message.

If you have his/her callsign or name, you should also try one of the on-line callservers shown above. This works in most cases. (!!!)

Also try directory assistance from the phone company or the locator service provided by the Salvation Army. A Salvation Army post in your local area may be able to help you. Also, the Quarter-Century Wireless Assn maintains a collection of callbooks going back to "the beginning of time". Their address is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a dial-in line for accessing new ham callsigns. Try (1-708-234-8011) at 2400 baud.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive these newsgroups as mail digests. Posting is also a one-shot thing. If you post and someone missed it, it is gone. A better way would be to announce the existence of your program here, along with information on how to obtain a copy of your program. You can also submit it to one of the FTP archive sites, which will allow the world to access it without you having to mail it to each requestor. If you just GOTTA post it somewhere, post it to more appropriate groups, like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

** Where can I get ham radio software for my computer?
Atari: John Adams KC5FW, 17106 Happy Hollow, San Antonio, TX 78232 "or tune into the weekly net Sundays 1600 UTC on 14.325 MHz".
MacIntosh: MacNet, John Seney WD1V 144 Pepperidge Dr, Manchester, NH 03103 (sent 2 800k FORMATTED diskettes, one of which contains a TEXT file containing your name, address, home PBBS, your radio & computer interests and equipment).

(See also the information about Anonymous FTP and ham-related telephone BBS's above.)

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs, hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)

Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a definitive listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above, substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
ARRL publications (i.e. conference proceedings, repeater directory) and more...

Except for the Callbook (via callsign servers), these are not available because of any of several reasons. Either there are copyright restrictions, royalty fees, or the source just may not have done the work. Also, not everyone that has information has reliable UseNet access.

In one example of someone's effort to bridge the information gap, there is a new repeater-mapping project which can automatically accept entries via e-mail. If you can get enough details about a repeater for a complete listing, you may want to help by submitting an entry. For more information, use the following e-mail addresses:

repeaters@wattres.sj.ca.us
Just send a message with only the word "help" in the message body. The project's software will reply with instructions.
steve@wattres.sj.ca.us
For other questions (Steve Watt KD6GGD)

As soon as the list is big enough to be useful, the project will make it available electronically. That will mean one less "why isn't it available electronically" question for the net.

4560. rec.radio.amateur.misc Frequently Asked Questions (Part 3 of 3)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 09:43:11 UTC

Rec.radio.amateur.misc Frequently Asked Questions
Part 3 - Amateur Radio Advanced and Technical Questions
------------------------------------------------------------------------------

Questions discussed in Part 3: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(6/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (6/93)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
```

Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician privileges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General privileges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code"
Technicians realize they can add more privileges to their license if
they learn Morse Code. The following list of suggestions should
be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever
you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character
plateau at 10 WPM by listening to the fast Farnsworth-paced
"beat" of each letter and the "beat" of common words. (See the
question on Morse code speed for more information on Farnsworth
pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters
behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test
may be in either format. (If you only practice one, you may fumble
on the other.)
* Most of all, don't give up! Recognize when you reach plateaus
and keep trying until you break through them.

** What is the standard for measuring Morse code speed?
The word PARIS was chosen as the standard length for CW code speed.
Each dit counts for one count, each dash counts for three counts,
intra-character spacing is one count, inter-character spacing is three
counts and inter-word spacing is seven counts, so the word PARIS is
exactly 50 counts:

```
PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^
```

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation [see rec.radio.amateur.space]
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version of RTTY. Also used commercially as SITOR (Simplex Teleprinter Over Radio). [see rec.radio.amateur.digital.misc]
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for downed aircraft and missing kids and uses frequencies just outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and does not require any license to operate [see rec.radio.cb]
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used to quickly check that you have not had a "duplicate" contact with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham. Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for 24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs who provide free communications for overseas GIs and other Federal services. MARS operators are licensed under DoD instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham

OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
[see rec.radio.amateur.digital.misc]
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
[see rec.radio.amateur.digital.misc]
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
[see rec.radio.amateur.space]
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
SWL shortwave listening [see rec.radio.shortwave]
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a
reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't

do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
First, check if there is a Ham Radio-related newsgroup specific to
your country. See the country-specific newsgroups in "the rec.radio.*
newsgroups" in Part II of this FAQ.

Also, write to the ARRL and ask. They can usually tell you how to get
a license in your country.

If you know of any location where this information is available
electronically, whether by an e-mail server, anonymous FTP, or a
contact person, please mail it to us so we can include it here. Send
it to hamradio-faq@amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)?
Editor's note (11/92): the regulations affecting this question are
being changed. Contact your local Volunteer Examiner (VE) and ask
about a VE 60-day pass. More details will be included in future
revisions of the FAQ.

This paragraph is soon to be obsolete:

You need to submit a FCC Form 610-A to the FCC, PO Box 1020,
Gettysburg, PA 17326. They will then send you a reciprocal permit
for alien amateur licensee (FCC Form 610-AL). You must be a citizen
of a country with which the United States has arrangements to grant
reciprocal operating permits to visiting alien Amateur operators.

This information is still current:

For FCC licensed hams operating abroad, the following guidelines
apply:
* A reciprocal license is required in all foreign countries (that have
a reciprocal operating agreement with the US), except Canada, where
the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them
which country you are going to visit and they will send you the
info and an application form. Foreign hams can likewise request
information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur
license (ie, notarized copy), and fee if applicable (use a bank draft
of a bank that does business in that country) to the appropriate
licensing administration of the foreign country. Processing may
take 30 to 90 days.
* If less than one month, you could try sending the application and
pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment
into their country without a license or permit. If you applied, but
haven't received the permit yet, show the copy and your FCC license
to the customs officer, however, the equipment may still be held at

customs until your departure.
* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
[see also rec.radio.amateur.antenna]
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.
* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.

2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".
3. Don't be accusatory, instead ask for assistance in resolving the problem. Try to work it out with someone technically knowledgeable.
4. Do mention your "licensed radio system", but try not to be too specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** Did you know that you can get college credit for being a ham? It's true! You can receive up to 14 credits in electronics and engineering thru placement tests for CLEP (College Level Entrance Placement) exams and DANTES (Defense Activity for Non-Traditional Educational Support) exams if you have an Advanced or Extra class Amateur license. For more information, ask your campus education office or (for DANTES) your military education office.

** On what frequencies do JPL and GSFC retransmit the shuttle audio?
[see also rec.radio.amateur.space]
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840
W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN (temporarily out of service - looking for new frequency)
KA9SZX 146.88 426.25
K4GCC 146.94
WA4VME 145.17
W6TRW 145.32

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on 40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL
K4GCC - Titusville, FL (near or at Kennedy Space Center)
WA4VME - Melbourne, FL (near or at Kennedy Space Center)
W6TRW - TRW ARC, Redondo Beach, CA (shuttle audio may be overridden by repeater usage)

** Can I take my HT on an airplane and operate it if I get the permission of the captain?
Technically, maybe. But don't count on it. In general, you can't use a radio or scanner on an airline (or charter) *unless* the airline allows it and the pilot-in-command (PIC) determines that it will not interfere with the instruments and radios on that specific aircraft. Very few US airlines allow passengers to use radios so be ready to

disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the HT (or any electronic equipment) onto the airplane. Generally, you can appease the security guards, simply by showing that the unit is operational and doesn't have a bomb inside. For a radio, just turning it on and opening the squelch satisfies them. Expect more difficulty during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you have the permission of the PIC. It is still possible for the radio to interfere with the plane's navigation or communication equipment, so be sure to ask first. Always obey the requests of the PIC. He knows his airplane and radios better than you do.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location, change of name, renewal, or even change of callsign), submit an FCC Form 610 to the FCC. Forms are available from the FCC or ARRL or a local VE session or ham radio store. Do NOT use a photocopy. Check off the appropriate boxes, fill in the new/changed information, SIGN THE FORM, and attach a copy of your current license (or a brief letter of explanation for its absence, ie, "my dog ate it"). NOTE: If you check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

** I'm confused about XXX, should I ask the FCC?
[see also rec.radio.amateur.policy]
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another.

This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organization (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 - old radios, TVs, ham equipment, 40s and 50s radios, telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q, Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb, NY 14469 - sponsors the Wireless Museum

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112 (10504-524-2343)

** What do I need to get started in packet radio?
[see also rec.radio.amateur.digital.misc]
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters and 70 centimeters are most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may

need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

Your first source of information on Packet Radio should be the rec.radio.amateur.packet newsgroup. It has its own regularly-posted FAQ that goes into much more depth on the subject than this one can. See also the mailing list and archives info in Part 2.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
[see also rec.radio.amateur.space]
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington, DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV), Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted pictures. (ATV includes moving pictures and audio just like your household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (See Part 2 for more information on FTP.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

The ARRL e-mail server contains an introduction to SSTV in the file sstv-info. (See Part 2 for more information on the ARRL e-mail server.)

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?
Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for

different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day plans some weeks before the (late June) event.

4561. Re: REQUESTING CUSTOM CALLSIGNS ???

>
>Richard Eckman
>NASA Langley Research Center
>Hampton, VA

Yes it is possible to procure such under $25K workstations and even more if a mass buy procurement was set up. This waiver of sums under a certain amount has been exempted from GSA review. However, mass buys because of their total amount often have to have an approval from GSA. In addition, NASA as an agency has the right to approve ADP procurements up to a certain amount without GSA approval. However, to get a full turn key system it is almost impossible to get past the GSA bottleneck. I know I have been involved with GSA waivers in 6 procurements during the last 18 months. These people really don't know what is going on in the systems world. They still treat all purchases as if one was buying an IBM 360.

Also, it is generally not possible in the government to go out a get the best workstation in the local market. While we in NASA, and I know in DOD, do have some very good mass buys that have excellent prices, I know of mass buys that have higher prices than purchasing at the best local prices. However, with these mass buys I can save time and procurement paperwork.

My view of the FCC was that they didn't need a couple of workstations but a redo of the system including no ADP. This would require them to purchase a "system" which would definitely put them in the GSA framework.

4562. Re: Repeater coordination, complaints?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 12:24:02 UTC
From: sampson@etowah.cs.unca.edu
Message-ID: <21ef92$5b4@balsam.unca.edu>
Source record: 279537

--

We have a similar problem with this type of interference here in
Western North Carolina. Even with the PL tone on the repeater output
there is still a problem with interference because of the following...

The repeaters is up transmitting the output PL tone causing a user's
reciever to be opened. If the interferring repeater comes up during
this time, the same annoying signal mix is still heard. So PL is
not a real cure its just a cover up patch. The only true way to solve
the problem the way I see it is for one of the repeaters to change its
operating frequency pair. Thus the burden falls right back to where
this discussion began... on the shoulders of Repeater coordination
groups.

This is my opinion only. 73 and good luck.

Revision: 1.4 06/30/93 12:04:14
Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July weekly
August bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>> board.

>The point of the matter is that PL decode isn't really necessary on that
>rig, or any other mobile or HT for that matter.

It's sure a good feature to have if you ever need to run your rig in crossband repeat mode, and you want to limit access to the input. It's also a good feature to have if you expect a call from someone on a busy frequency and don't want to listen to the rest of the jabber (though I usually use DTMF squelch for that purpose - but I guess in your book there's really no need for DTMF decode on anybody's mobile or HT either).

Just because you don't take advantage of a feature doesn't mean a lot of other people don't.

> As for the lack of DTMF
>decode... the FT-5100 has it

I see. Since your rig has it, it's "really necessary" after all.

>... and alot more memories. A better radio in
>my opinion, but if you bought the 5200 because of the detachable face,
>well... good luck with it and hope you enjoy it. You got rooked.

Well, Tone, actually I *didn't* get rooked. I very deliberately decided on the 5200 over the 5100 because I wanted remote-head capability, and reasonable power output on crossband repeat (yer 5100 will only do 5 watts - the 5200 does 50). Boy, I sure am sorry I don't have a hundred memories, though. Every ham needs 70 or so empty memories in his rig to be really cool.

I'm glad YOU don't need one. From hills in southern New Hampshire, or
if conditions are particularly good as they have been recently, we are
frequently hearing the repeater in Dennis (or Yarmouth), which in this
year's directory is no longer listed as uncoordinated. This is why
the repeater in Nashua has 100.0 hz PL on its _output_, for those
fortunate enough to have PL decode in their HTs and mobiles.

4571. ICOM IC-24AT Questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 18:17:59 UTC
From: hmn@unity.ncsu.edu
Message-ID: <1993Jul7.181759.27503@ncsu.edu>
Source record: 279551

--

Hi,

I've just purchased an ICOM IC-24AT. It's my first HT and I'm quite impressed
with it functionality and performance. I've already expanded the Rx
capabilities with the software mod via the HAMserver.

But I've got some questions about powering this unit:

1) Do I need to purchase the ICOM cig. lighter cord, or can I just by
one with the correct tip from Radio Shack? The documentation says that
it will operate from 6-16v, so will a 12V cable from RS work?

2) When the unit is powered from the cig. lighter, do I keep the battery
(BP-82) attached? In the manual it states that the unit shouldn't
be turned on when charging the battery.

Any other hints, tricks, tips, or ideas are more than welcome.

Thanks in advance,
Harry Nicholos

>the repeater owners.

Perhaps I'm missing something, but how does this scheme work? I'm thinking of a case where a user is located somewhere that he can't hear NO6B's output, but he's trying to use your machine. Key up... nothing...key up...nothing...key up...nothing...all the while, because a conversation, or a net, is going on NO6B at the time. Admittedly, the user wouldn't be able to use your machine in any case because NO6B is on the frequency, but it would suck to be unable to get through and not have a clue as to why.

4576. Re: Antenna Questions For New Ham

Newsgroup: rec.radio.amateur.misc

> 1. About my radio (Kenwoord TS-120s), I got a good deal and a local ham I
> know thinks its a barely acceptable radio. Any comments about my
> purchase (I paid 325 incl shipping for it).

It's a perfectly good radio. $325 is even an OK price for it. It's lacking some features, but at this point you're probalby not going to miss them.

> 2. Because of the proximity of the phone and cable wires can my
> neighbors expect any RFI problems?

They're going to expect problems no matter what you do! However, I would nix the 300 ohm twin lead. This cheap stuff made for TV is made with so much variation and isn't waht the tuner wanted anyhow. Just get a hunk of RG-58 instead. It's going to be smaller anyhow. It's a possibility that both will be affected or neither.

> 3. How will my height and location affect DX'ing?

Hard to say, antenna's are spooky. I worked Diego Garcia island on a 20Meter antenna in my attic. Another 20 meter dipole that's located between some trees about ten feet off the ground reliably pulls in New Zealand and Australia. I've worked Japan on an extension ladder stood upright and loaded at the base. It's certainly not the best antenna system, but it doesn't rule out DX.

> 4. I am going to be installing a ground rod and I need to know
> the best way to ground this antenna for lightning protection.

The best way is to unhook the wire from your tuner when your not using it and ground it.

> 6. From the handbook I think this antenna will work like a standard dipole.

Well, it's not a dipole because it's not at 180 degrees and not high enough off the ground. It's going to have an UNPREDICTABLE radiation pattern.

> 7. Will the fact that part of the antenna is blocked by the house be
> much of an issue?

Since the radiation pattern is already going to be unpredictable, I wouldn't worry about the house effects much.

>$100!!! ;^)

Well, perhaps. As a starving grad student, I'm still using my old
Ten-Tec 2591 HT on 2 meters. I bought it in 1983, and it still works
fine...except that usable repeaters are starting to get few and far
between, what with everybody in sight going to PL. You see, it has no
PL encode or decode, and no room inside to put that "$30 PL board".
Right now, it's a race between the march of technology and what I am
fervently hoping will be a significant improvement in my personal
finances after I (hopefully) graduate. Some people have reasons to be
using outdated rigs, other than the much-repeated "hams are cheap".
Or at least some of us have reasons to be cheap. :-)

Hi there Joe,

I beg to differ. I personally own a FT-5100, as well as three other hams in my area, and all of our units do a full 50 watts on cross band operation. I think you got some mis-information or possibly there is a version of the 5100 out that has now been altered to not provide the full power out (I seem to doubt it though). Our units are from 7 months to 2 months old.

Just setting the record straight.

73,

Will Collier

The "cigarette lighter" cord contains some noise elimination filtering
also. I've used my 24AT direct with just a home made adapter cord
with no problem in two of my cars, but the third car I experienced
noise on transmission as reported by others. I bought the ICOM
adpter and I eliminated the noise.

So, depending on the vehicle, you may or may not need the benefit
of the noise filtering you get with the ICOM adapter.

>2) When the unit is powered from the cig. lighter, do I keep the battery
> (BP-82) attached? In the manual it states that the unit shouldn't
> be turned on when charging the battery.

You can leave the battery attached. The reason they tell you not to turn
the unit on when charging is limited to charging with the small AC charger
that comes with the unit. The DC output of that charger is unfiltered.
Works fine for just charging the battery, but not good for regular
use, especially when transmitting.

4583. PD shareware ham software for MSDOS

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 22:00:11 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9307072201.AA16884@netmail.microsoft.com>
Source record: 279556

I just got a T1000 cheap to run all that wonderful DOS ham software I keep hearing about (I'm a Mac-head in all my other machines so the previous statement should be taken with a :-). One intention is to use it portable.

Are there any collections of stuff about the net that I can use on this machine (slow 8088 + CGA). Looking for SuperMorse and other morse trainers, contesting programs, loggers or QSL databases, propagation, sat trackers, packet (both PMP and usig a real TNC) and so on.

Any hints, tips or suggestions on must have software (even if it is commerical) is appreciated.

Thanks,
Kevin Purcell N7WIM / G8UDP

Does anyone know if the alt.radio.scanner group is still in existence?
I no longer can see it, and am wondering if its gone, or just filtered
out.

Ben (bcristi@novell.com)

4585. Kenwood 7850 problem

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-07 22:05:09 UTC
From: hudson@ualr.edu
Message-ID: <1993Jul7.160509.1@ualr.edu>
Source record: 279555

--

I recently bought a used Kenwood 7850 2 meter rig. It works very well
with one exception. The memories sometimes erase when I turn the thing
off, even though the NiCad backups are charged and in good shape. This
rig is supposed to use the 12 volt supply to apply a trickle charge to the
NiCads, and all of that seems to be working, with the batteries staying
in a good state of charge. I suspect a small plug on the back of the rig,
which is used to connect a small wall-mount transformer for base station
use memory backup. There is a small switch apparently inside this plug.
It appears to be not making contact properly. Has anyone had any
experience with one of these rigs and the problem I am experiencing?

Thanks,
Keith

I live in Reno, where the Earthwinds launch is scheduled to occur next winter sometime. I believe the launch window starts in late November and extends until about February.

I hope to be learning more particulars in the next few days and will post anything that seems interesting.

Thomas Jay Pachner (pachner@csd4.csd.uwm.edu) wrote:
: On Saturday, July 11, 1993, I will be taking my novice and technician this
: saturday at a local hamfest. Does anyone have any last minute advice?

1) Don't leave any questions blank. If you don't know, guess. There
is no penalty for wrong answers.

2) If you must guess, guess intelligently. Eliminate any obviously-wrong
answers. If two or more answers are similar, one of them is probably the
right answer. For example, if the answers are (a) 2 ohms (b) 3 amps
(c) .3 amps (d) 75 amps, then the answer is probably (b) or (c).

3) Take your time. If you're nervous, skip the hard answers and come back
to them later. But don't second-guess your first answer and go back and
change it, unless you are certain it is wrong. Your first guess is
usually corrrect.

4) On the code test: Don't forget to go back and fill in as much of the
missed material as you can. If you copied:

"NAME IS WILL__M AND QTH IS MIL_AUKEE"

You can pretty well guess what should go in the blanks. If you don't
pass the 10-question code test, you can still pass by getting one
minute (25 characters at 5 WPM) of perfect copy.

5) On the code test, be aware that every exam uses every letter, number,
punctuation mark and prosign at least once. One of the callsigns will
usually be portable, in order to include the "/". Likewise, the
callsigns often have Z, X or other unusual letters that are hard to
work into the text. There will almost surely be a ...-.- (SK) at the
end, since that's the only place that prosign is normally used.

6) Again on the code test: You will get TWO chances to copy the two
callsigns: Once at the beginning and once at the end of the transmission.
When the test is over, compare what you copied both places -- what you
missed one time, you may have got right the other. Getting the callsigns
is almost enough to pass the test: "WA6XYZ DE WB3ABC/6" counts as 20
characters (numbers & punctuation count double), which is nearly a
minute at 5 WPM!

A discussion is currently underway in news.groups about renaming
alt.radio.scanner as rec.radio.scanner since 1) the group is active and mature
and 2) many sites cannot receive the alt newsgroups. The discussion will be
followed by a vote.

I encourage you to post something in news.groups on the subject if this rename
matters to you.

How does one determine the size of a "capacitance hat", used to make electrically-too-short antennas resonant? I've seen them used on antennas in the ARRL Antenna Book, but not how the size used was derived.

Also, how about the building coils into an antenna element to increase its electrical length? Is that "better" than capacitance hats? Also, how is the size computed?

Have you investigated the Communications Specialists SS-32HB? I put one of those *between* the two boards inside an IC2AT. It'll fit in ANYTHING!

They're cheap and reliable. I think the last one I bought was $19.95. They also have a encode/decode board that isn't much bigger. They're programmable with soldering across pads on the board, but I usually find somewhere on the HT to put a 5 position DIP switch for the PL selection.

It might help you get PL without breaking the bank!

LAPD uses multiple transmitters in its 800 mhz system. They have
about 30 freqs, with several xmtrs on each one, depending on what
it takes to cover the zone. FM's capture effect reduces the
size of the interfence bands somewhat (wider dev, in the old days,
would have worked better, of course). However, there when you get
into an area with roughly equal sigs from two xmtr sites, it can
begin to sound pretty horrendous. The xmtrs aren't phase locked -
I'd guess they're only within 200 hz of another, given the beats
that I can hear. The coverage they need is sort of cellular, with
relatively small areas for each freq. I'd guess it would work
much less well if one were trying to cover all of LA with one
freq and more xmtrs. The PD system has the advantage of being
able to place at least some of the interference bands outside of
the particular zone they're trying to cover.

But in the UK *any* person with any sort of amateur licence is not considered to be a 'third party'. So I can quite happily let a VHF-only licensee use my HF station under supervision ('supervision' is not particularly well defined in the UK licence :-)) I think recent changes even allow anyone who has passed the relevant exams and who isn't barred from holding a licence to operate without being a 'third party'.

This is a joke right?

Is it just me or is the literacy level in amateur really this low?

I mean for all the finger pointing about the CBers and the no-code
techs, you would think that as a group we could do better than this.

From: dave@esi.COM.AU
Message-ID: <4216@eram.esi.COM.AU>
Source record: 279481

In article <21hml5INNlhs@matt.ksu.ksu.edu>,
steve@matt.ksu.ksu.edu (Steve Schallehn) writes:

| Are there any repeater systems or repeater networks that use multiple
| transmitters on a single frequency?

I'm not aware of any in Amateur use (sounds like an interesting way
to go), but at least one communications company in Australia is
playing with the idea. I think they derive their reference timing
from one of the rubidium-locked TV transmitters in Sydney.

4608. HAM-server index of files

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 06:59:21 UTC
From: HAMSinfo@GRAFex.Cupertino.CA.US
Message-ID: <gate.mLJe7B1w165w@GRAFex.Cupertino.CA.US>
Source record: 279485
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,sbay.hams

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: ----------

If you do not know how to use HAM-server, send email to
HAM-server@GRAFex.Cupertino.CA.US. In the text, place HELP.

If you order a file and do not get it, check the index to be sure you have
spelled the filename correctly. If you have ordered the file correctly,
then order a new INDEX, as I may have moved the file to a different
directory. The system is still expanding, and I am trying to keep it in
managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it
might be because your return path is incorrect. My bounce mailbox fills up
quite regularly with bounce messages. And, since the path is incorrect, I
cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are
ignored.

A new INDEX is automatically generated weekly and when files are moved or
added.

/hamradio/newfiles/ contains files that have not yet been categorized. You
can order a list of newfiles by sending the following in an email.

NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should
run across one of these, please let me know with email to
KA6ETB@GRAFex.Cupertino.CA.US

4609. 211/845 Transmiiter Tube WANTED....

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 07:16:39 UTC
From: shwlee@hkucc.hku.hk
Message-ID: <1993Jul9.151639.1@hkucc.hku.hk>
Source record: 279493

Would anyone sell me any RCA, UE or GE 211, 845, 845W transmitter tubes ?
There should be many transmitter tubes in the past 30 years, but where are
they now ?

I'm interested in all kind of transmitter tubes, but I'm not using them in
HAM radio, instead they are used in my audio equipments !

Any information or source, please e-mail to me :

SHWLEE@HKUCC.HKU.HK

Thanks in advance,

Simon

4610. In search of KH6SP club members from the past

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 07:24:37 UTC
From: rbc@pegasus.com
Message-ID: <1993Jul9.072437.19600@pegasus.com>
Source record: 279487

During field day a few of those operating may have heard the call sign KH6SP from the island of Oahu in Hawaii. The call sign is held by the US Navy Morale, Welfare and Recreation committee and presently, is not directly associated a club at Pearl Harbor.

There are a number of people in the local Hawaii area that would like to bring the original club back to life but there is little information about the club in it's previous form.

If anyone out there could supply us with information regarding the club we would be happy to hear it. Please send E-mail to rbc@pegasus.com, or bcollars@pegasus.com. We can also be reached at (808)472-7394 as Robert Carleton or Brett Collars.

Thanks in advance,

Robert Carleton

I got through using the supplied IP number (155.212.2.2) but asking
our nameserver I got a different name for the site:
anomaly.sbs.risc.net

4612. Re: Repeater systems with multiple transmitters

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 08:08:51 UTC
From: bote@access.digex.net
Message-ID: <21j92j$98p@access.digex.net>
Source record: 279484

steve@matt.ksu.ksu.edu (Steve Schallehn) writes:
>Are there any repeater systems or repeater networks that use multiple
>transmitters on a single frequency?

Maryland FM Association's 146.76 has a low-power slave
transmitter in northwest Washington, D.C.
It's frequency differs by less than 100CPS from
the main transmitter in Jessup, MD some 25 miles to
the northeast of it. I believe that it is locked
to WTOP-AM since that is a 24-hour station.

The intereference products along the Capital Beltway
in Maryland make it difficult to listen to when
it is on: the slave has a mind of its own as to
when it wants to transmit. :)

Well, I tried the 155.212.2.2. Other than being a little slow in response, it worked nicely. I didn't try the alpha address.

> If you do buy it let me know how it works for you and you opinion to it.

You know, this brings up a good point. You work in a what's supposedly called "America's Technology Store" and they won't let you play with the stuff, even though you're a licensed amateur? How the heck else are you suppose to learn what the rig can and can't do. Reading the manual is ok, but you learn by doing. Print this out and show it to your manager if you want. This explains why alot of RS people are totally clueless when it comes to their products. If it doesn't have a catalog number, it doesn't exist. {sigh}

WARNING: I work part-time for Radio Shack. Some of the things I say may be interpreted by some as commercialism. If that offends you then read no further.

At RS 01-6358 in Center Line, MI we are encouraged to get some first hand experience with all the equipment. It's a little tough to keep up ones sales volume while reading/operating/playing/... but we try. We have a very knowledgable sales team and it shows in our sales numbers. If there's an area where one of us is less knowledgable than the other it's not uncommon to refer the customer to the more knowledgable sales person. You just can't be a good salesperson unless you have a good understanding of the product you're selling. That goes for real estate, electronics, cars etc.

I wish the company would allow us to take things home for a couple days. That would be MUCH more effective than a few minutes here and there between customers or a few hurried minutes in the store on personal time.

>avoid interference, although I bet receiver capture is more important
>to system performance.

This is done with VHF civil airband meteo information transmitters. Two or more (three, four, five) transmitters are frequency-offset by about 7.5KHz from the master-transmitter frequency. They are not phase-locked, the aviation-types just put a tight LPF in the audio chain to filter out the 7.5KHz heterodyne caused when 2 or more transmitters' carriers beat with each other.
Of course, this is using good old double-sideband, full-carrier AM. The same sort of thing can be done with FM if you use a PLL-type demodulator that will lock to whichever of the carriers is the strongest. Discriminator-type FM demodulators sound truly horrible under these conditions; capture-effect is just not good enough to recover clean audio.
The big problem is to ensure that the demodulated audio signals arrive at the speaker with the same phase relationship irrespective of which transmitter they come from. this is *hard* (you need to know the number of stages of amplification your signal will pass through for each path, and whether each stage is an inverting (e.g. common-emitter) or non-inverting (emitter-follower) type amplifier.

: techs, you would think that as a group we could do better than this.

It is generally considered bad manners to criticise grammer or
spelling on this net. It is also not without risk, as someone
immediately points out something wrong with the grammar or spelling
in the criticism ! (sorry !)

There are people making valiant efforts to express themselves in
what to them may be a strange language. I would not want to risk
discouraging them.

Unfortunately, there are people whose native language is English,
who are so poor that their output is indistinguishable from the first
attempts of someone beginning to learn this language. Criticism in these
cases is just.

In individual cases, leaping into criticism is unjust due to the
unreliability of being able to discriminate between the beginners and
the illiterates. In general, the beginners seem to me to be in the
minority, yet the incidence of basic errors is so frequent that I too
believe that there is an embarrassing problem.

The people who know the difference between "Your" and "You're"
and between "Loose" and "Lose", for example, seem to be a small
minority. Such errors in text from someone, who otherwise does not appear
to be a beginner, makes me wonder if they took similar care over the
meaning of what they are trying to say.

Now, I wonder what errors I made in the above text ?

>callsigns is that they got too lazy to figure out what was available to
>reissue.
>-Ron

i guess i would consider not using the word "lazy" for this context. this infers that the FCC is supposed to be issing special calls but doesn't feel like doing it this week even tho they said they would.

the fcc's got more on their plate today than they had 20 years ago and probably less people. I also recall a problem with how the payments were handled - this about the same time the FCC was getting beat up by the broadcasters over their fees having no visible means of justification (also not being authorized by Congress to set and collect fees in the first place).

the lack of special callsign issuing ability probably is due more to the old special call system, continued growth in amateur radio and the 1970's budget cuts than a "lazy" FCC.

Darrell NR3Y says:

>The symptoms are a loud cracking sound which occurs periodically when the
>amplifier is warm. This occurs whether the amp is in operate or standby mode.

I had the same thing happen to my 3-500Z amp for 6 meters. The amp was built from a Dentron multiband HF amp. The power supply in it uses a string of 450VDC electrolytic capacitors in series to withstand the 2250 VDC plate supply. The caps are built with the metal shell connected to the negative side. Each cap has a bakelite insulator/mounting plate to attach it to the metal chassis of the amp. A cardboard insulating sleeve fits over the metal shell. What happened with my amp was that one of the sleeves worked its way up a bit exposing the metal rivet that goes thru the bakelite mounting plate. One edge of the rivet was then very close to the metal shell and the other edge wasn't far from the chassis. At some point, an arc-over occurred, laying down a nice carbon arc path. At first, I got an arc over once in a while, but later (at the 1992 June VHF QSO Party, of course!), I had constant arc overs. I didn't find the problem until many weeks later. Sigh...

If your Henry amp uses a series configuration of filter caps, you might be experiencing the same thing I was!

Yes, I agree that clarity of writing enhances my opinion of the writer's clarity of thought. I am not alone in these sentiments; observe the three article excerpts which follow. Note that the first one of these was posted to the net almost 10 years ago, when Usenet was only a few dozen sites!

I urge people who are not naturally good at communicating in writing to take just a bit more care that what they write is clear and understandable. Rigidly correct grammar and spelling are not necessary, but when the errors are so great in number that they obscure meaning or distract the reader, communication suffers. Most people who don't write or spell well know it, and know that to be understood they really do need to take a bit more care. We will ALL benefit thereby.

As a bit of incentive: remember that all postings to the ham radio groups are permanently archived. Your words are not fleeting. What do you want future readers to think of you?

Okay fool, you might have a point if we nitpicking assholes got peeved about an occasional error. BUT it's not the occasional error that bothers us; it's the chronic one that turns us into screaming grammarians. 'Look for the content,' you say. It is impossible to look for content destroyed by bad grammar, bad usage and bad style. Every person who's ever written anything and had it criticized because of misspelled or improper words has cried, 'You didn't even look at what I was trying to say!' So what? What sort of insight can I expect from someone who hasn't the brains (or, more likely, the desire) to be sure that what he or she wrote was correct? None, at least that's what I feel when I read some piece of illiterate, content-charged garbage.

If what you have to say is important, take the time to couch it in terms that will convey its importance (and I do not mean obscure it with polysyllabic latinates and convoluted language). Ideas put forth clearly, precisely and correctly exert much more force than the same ideas put forth in ungrammatical constructions.

I doubt very much that is all that difficult to write a grammatically correct article. Most people really do know how to write or at least have access to something that will tell them what is correct and what isn't. A dictionary and the MLA Handbook can work wonders.

Hey, this is fun!

In article <22675@netcom.UUCP> jfh@netcom.UUCP (Jack Hamilton) writes:

>Clay, perhaps you should give up and become a descriptive rather than a
>prescriptive grammarian.

I don't imagine that many here -- Arnold and Rob, certainly, perhaps Jess -- really understand the delicate line I walk between the two. This is mostly because almost nobody other than linguists have any idea what a linguist *is*, though many *think* they know.

I am, by interest and training, a linguist. Linguists have little, if any, use for prescriptive grammar -- and for very good reason. I am also, by training, an English teacher, and pedagogy alone requires some prescriptivism. On top of all that, even linguists are allowed to have their little quirks and annoyances, though they're likely to feel a bit guilty about having them.

There's a great difference between written and spoken language. The first is a frozen representation of language, the second is

the real thing -- alive, dynamic, chaotic, and exciting. Written language follows a standard form which does not exist in spoken language, in English and most other languages, a rough representation of some dialect spoken in the past but currently dead. Written language, at least non-fiction, must be clear, clean, and to the point to qualify as "good writing." Phrases such as "what I really mean to say" on the fourteenth line of the paragraph are inexcusable, but all too common; if it was what you meant to say, then why the hell didn't you say it in the first place, and save fourteen lines of redundant, muddy babble?

I get mail asking for references of "good grammars" so that people can become better writers. The only thing those Latinesque things which have nothing at all to do with the English language accomplish is ruin people's writing. Other than Noam Chomsky, the worst writers alive are academicians in English departments, who cannot even write a simple memo without filling it full of polysillyabic "learned" borrowings -- instead of clear, straight-forward Anglo-Saxon words.

Prescriptivism, Jack? No, prescriptivism is the reason so very few English speakers can write.

More than half of basic English vocabulary is made up of short, meaningful Anglo-Saxon English, and most of those words mean nearly the same thing as they did when Chaucer wrote. Basic English *is* basic English because those humble, unlearned native Anglo-Saxon words are most often the best words for what we want to say.

The best way to learn to write well is to write summaries. The better one is at taking an article and condensing it into as few words as possible, the better one will write. Keep dictionaries and stylesheets for reference, but there is nothing that will teach one to write except writing. Lots of writing. I work my students to death, but it pays off.

As you almost suggest, good fiction writing can be as real as spoken language. I think it is often more exciting than spoken language, not out of any inherent superiority but rather because of the ways both are commonly used.

Truly great use of the spoken language is increasingly rare, witness the paucity of great lecturers in most universities, courtrooms, and legislative councils, once the venues of some of the most stirring and provocative rhetoric one might hear.

But in fiction writing, the tradition of using the language to create imaginative universes the likes of which would defy spoken utterance is alive and well. Somewhat in both bailiwicks are poetry and drama, where the written language is not fully actualized until it is spoken. In the case of drama (poor poetry, the eternal stepchild, at least in English), the relationship between the writer and the actor bridges -- synthesizes may be a better word -- the worlds of written and spoken language, in the best examples to the great advantage of both.

So I think it would not do to leave the impression that the spoken langugage is the only "real" manifestation, in case some readers glossed over (ha ha) your phrase "at least nonfiction."

>The best way to learn to write well is to write summaries.
>The better one is at taking an article and condensing it
>into as few words as possible, the better one will write.

Early in his career, Chekhov was a journalist. Among his duties was to write filler material (a more important activity in the days when newspapers were matters of lead type). He said this work taught him a lot about expressing himself in the minimum number of words. This was evidently a foundation for his incredible economy and compactness.

To generalize a bit on *how* to learn to write, one of the key elements is to learn to read, really read, I mean. Not just to get through what is said, but to notice how it is said and why it was said in that particular way from among the many alternatives the writer might have chosen.

Similarly, in music it is as much the listening as it is the playing, and often a composer's main task is create a sound-picture that could not have been heard before. One reason we dote on the classics is that no matter how many times we listen to certain works, we keep hearing more in them.

There's a good comment on this sort of thing by Picasso, who says: "There are painters who transform the sun into a yellow spot, but there are others who, thanks to their art and intelligence, transform a yellow spot into the sun." NB the illumination of his use of the word "art."

As to training, learning how: possibly the *most* important of *all* things is the doing itself. Poor Schubert, dead at 31, left us a thousand pieces of music. Egon Schiele, dead at 28, left us a thousand paintings and drawings. (Sorry, a comparable writer does not occur to me at the moment; there must be many.) The idea's as old as the hills : one learns by doing.

As you note:

>Keep dictionaries and stylesheets for reference, but there
>is nothing that will teach one to write except writing.
>Lots of writing. I work my students to death, but it pays
>off.

Musicians, especially, get diverted by technique. Surely we've all heard lots of concerts that were perfect but deadly so.

When all is said and done (thank god it never really is), to be an artist is merely to find the heart's commands inevitable.

RE: Subject: TUNING A WIERD LOAD....

>>I have an interesting r.f. matching problem.

To say the least!! What you have is a real dilemma!
(stuff deleted)

>>I can provide a good match (less than 1.3:1 SWR CW@18.134MHz) but
>>when stuff starts to change in the experiment so does the impedence.
>>we still cook things when the impedence changes quickly.

Since you can't get the matched condition down to 1->1 I would suspect
that the load is quite reactive, and your tuners are not capable of
dealing with the load in a stable state just for starters. Contrary
to popular opinion, there are NO tuners made by man that are quite as
capable as we are often led to believe. They all have some range of
impedance values they can actually handle designed in. What you most
likely need to do is lower the Q of the matching device to begin with.
That will allow the tuner to deal with a broader range of load condition
and still present something the generator can deal with. This is the
situation with the input circuits of most linear amps designed for use
by hams by the way. The reason there is that the typical cathode
driven amps run class B, and the input impedance to the amp varies
wildly when driven by the typical speech waveform, or on/off keying
of CW. Perhaps taking a look at what some of the amps actually do
in those input circuits would give you a real strong hint at where to
start, or maybe even how to resolve the difficulty successfully.
You probably NEED to know the actual impedance of your load
to get in the "ballpark", so to speak. Remember that 3->1 could mean
either 150 ohms, or 17 ohms when the target is 50. Obviously, those
values demand quite a different set of parameters in the matching
device! Not to mention the impact on the generator (ur 781 or whatever)
when its looking at them, trying to deliver power!

Be careful, and good luck!

I'm thinking about getting a new 2M mobile rig. I've
been out of the market for many years. The last mobile
rig I bought was a Kenwood TR-7400 back in the early
1970s. The rig still works, but now I have a smaller car
and want a smaller rig. Plus, I know there are many new
features available since that time.

What is the hottest rig in the smallest package for the best
possible price (hopefully ~$250.00 or less).

Thanks for the help.

"Spectrum", a new international communications and technology radio program
airs Sundays at 0335 UTC on WWCR, Nashville, Tennessee on 7435 KHz shortwave,
and the Let's Talk Radio Network on Spacenet 3, transponder 21, 5.8 MHz
subcarrier wideband audio. The program is hosted by Dave Marthouse, N2AAM,
a long time radio enthusiast, OSCAR satellite user and professional
broadcaster, and Mark Emanuele, N2CBO, a professional communications
consultant, and features produced segments on all aspects of communications
ranging from DC through light. In addition, there is a live call in segment
with guests from the field of radio communications.

* REQUEST FOR FO-20 USERS *
===========================
ANTIGUA GUATEMALA, 29 JUN 1993

DEAR JOHN,

LET ME TELL YOU THAT IT IS ALWAYS A PLEASURE FOR US FEW HAMS
HERE IN GUATEMALA TO READ YOUR SPACENEWS. AT PRESENT YOUR
BULLETIN COMES TO US VIA THE APLINK NETWORK, AND THE APLINK
SYSOPS IN THE US, CHILE AND HERE IN GUATEMALA ARE DOING A GREAT
JOB FOR US.

HOWEVER, SINCE I WORK SATELLITES MODE JD I FEEL THE JOB TO
DISTRIBUTE YOUR BULLETIN COULD BE DONE SOMEWHAT BETTER. AMATEUR
SATELLITE FO-20 FOR INSTANCE HAS VERY FEW USERS, EVEN WHEN
PASSING OVER THE U.S. IN ONE PASS I CAN EASILY DOWNLOAD ABOUT
15K BYTES OF DATA, SO WHY NOT SEND YOUR BULLETIN AROUND THE
WORLD VIA FO-20? IF ONE OF YOUR FRIENDS OR FELLOW HAMS IN YOUR
AREA HAS THE CAPABILITY TO WORK SATELLITE MODE JD, PLEASE ASK IF
HE COULD UPLOAD YOUR BULLETIN TO FO-20 WHENEVER IT IS AVAILABLE.
I WOULD DOWNLOAD IT HERE IN GUATEMALA AND FEED IT INTO THE

LATNET (LATIN AMERICAN PACKETNETWORK), WITH LINKS ON VHF TO ALL
CENTRAL AMERICA, AND ON HF TO SOUTH AMERICA AND POLYNESIA. WHEN
I UPLOADED YOUR BULLETIN TO FO-20, I COULD SEE IT WAS DOWNLOADED
SEVERAL TIMES FROM US HAMS, AND THEY HAVE FAR BETTER ACCESS TO A
TERRESTRIAL PACKET BBS THAN WE HAVE DOWN HERE.

BEST WISHES, MNY TNX AND VY 73 DE MANFRED, TG9IKE AT TG9SO.GTM.NA

At the present time I am unable to access FO-20 with my limited antenna
system. If anyone with Mode JD capability would like to upload
SpaceNews to FO-20 on a regular basis they are certainly welcomed to do
so. If any individual who is willing to do this also has Internet mail
capability, I can add your e-mail address to my SpaceNews distribution list
in an effort to bring you these bulletins in the shortest time possible.

Feel free to contact me via any of the paths listed below. Thanks!

* MIR QUESTIONS AND ANSWERS *
==========
Questions from the
BROAD STREET SCHOOL
NASHUA, NEW HAMPSHIRE
GRADE 3 MRS. PORTER'S CLASS

Sent to the Russin Space Station MIR on June 3, 1993 by Amateur Radio.
The answers were received June 9.

Jessica Bushell 8:
Q: Can you see other planets?

ALEX:
A: Yes, we observe Venus, Mars, Jupiter and once we have seen Saturn with
it's rings using binoculars. Through the binoculars we could see 4 of
Jupiter's satellites, Io, Europe, Callisto and Ganimed.

Lauren Oscilowski 9:
Q:What is it like to be in space for 6 months? Do you ever feel sick?

ALEX:
A: We are living in space with Gennady for 4.5 months now. Gennady has
spent approximately the same amount of time in his first mission.
But we are not bored up here - one can work in different roles: as a pilot,
doctor, cook, actor, mechanic and so on - it is very interesting.
On the first days of the mission, a cosmonaut may have the motion sickness
- dizziness, nausea. But we got lucky - we didn't have it.

Emily Comeau 10:
Q: Do you ever miss your family?

ALEX:
A: Sure, we reminisce about our families sometimes. Phone conversations,
video and audio records, letters, arriving with "loadtrucks" (that is how
we name transport spaceships carrying cargoes for us) help us to bear with
the long time apart. With the last "loadtruck" my daughter set me her

sewing application - lilac bouquet. I have pinned up in my room next to
the "illuminator" (round window - translator's remark).

SpaceNews
=========

MONDAY JULY 12, 1993

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* SPECTRUM ON WWCR *
====================
"Spectrum", a new international communications and technology radio program
airs Sundays at 0335 UTC on WWCR, Nashville, Tennessee on 7435 KHz shortwave,
and the Let's Talk Radio Network on Spacenet 3, transponder 21, 5.8 MHz
subcarrier wideband audio. The program is hosted by Dave Marthouse, N2AAM,
a long time radio enthusiast, OSCAR satellite user and professional
broadcaster, and Mark Emanuele, N2CBO, a professional communications
consultant, and features produced segments on all aspects of communications
ranging from DC through light. In addition, there is a live call in segment
with guests from the field of radio communications.

* REQUEST FOR FO-20 USERS *
===========================
ANTIGUA GUATEMALA, 29 JUN 1993

DEAR JOHN,

LET ME TELL YOU THAT IT IS ALWAYS A PLEASURE FOR US FEW HAMS
HERE IN GUATEMALA TO READ YOUR SPACENEWS. AT PRESENT YOUR
BULLETIN COMES TO US VIA THE APLINK NETWORK, AND THE APLINK
SYSOPS IN THE US, CHILE AND HERE IN GUATEMALA ARE DOING A GREAT
JOB FOR US.

HOWEVER, SINCE I WORK SATELLITES MODE JD I FEEL THE JOB TO
DISTRIBUTE YOUR BULLETIN COULD BE DONE SOMEWHAT BETTER. AMATEUR
SATELLITE FO-20 FOR INSTANCE HAS VERY FEW USERS, EVEN WHEN
PASSING OVER THE U.S. IN ONE PASS I CAN EASILY DOWNLOAD ABOUT
15K BYTES OF DATA, SO WHY NOT SEND YOUR BULLETIN AROUND THE
WORLD VIA FO-20? IF ONE OF YOUR FRIENDS OR FELLOW HAMS IN YOUR
AREA HAS THE CAPABILITY TO WORK SATELLITE MODE JD, PLEASE ASK IF
HE COULD UPLOAD YOUR BULLETIN TO FO-20 WHENEVER IT IS AVAILABLE.

I WOULD DOWNLOAD IT HERE IN GUATEMALA AND FEED IT INTO THE
LATNET (LATIN AMERICAN PACKETNETWORK), WITH LINKS ON VHF TO ALL
CENTRAL AMERICA, AND ON HF TO SOUTH AMERICA AND POLYNESIA. WHEN
I UPLOADED YOUR BULLETIN TO FO-20, I COULD SEE IT WAS DOWNLOADED
SEVERAL TIMES FROM US HAMS, AND THEY HAVE FAR BETTER ACCESS TO A
TERRESTRIAL PACKET BBS THAN WE HAVE DOWN HERE.

BEST WISHES, MNY TNX AND VY 73 DE MANFRED, TG9IKE AT TG9SO.GTM.NA

At the present time I am unable to access FO-20 with my limited antenna
system. If anyone with Mode JD capability would like to upload
SpaceNews to FO-20 on a regular basis they are certainly welcomed to do
so. If any individual who is willing to do this also has Internet mail
capability, I can add your e-mail address to my SpaceNews distribution list
in an effort to bring you these bulletins in the shortest time possible.

Feel free to contact me via any of the paths listed below. Thanks!

* MIR QUESTIONS AND ANSWERS *
==========
Questions from the
BROAD STREET SCHOOL
NASHUA, NEW HAMPSHIRE
GRADE 3 MRS. PORTER'S CLASS

Sent to the Russin Space Station MIR on June 3, 1993 by Amateur Radio.
The answers were received June 9.

Jessica Bushell 8:
Q: Can you see other planets?

ALEX:
A: Yes, we observe Venus, Mars, Jupiter and once we have seen Saturn with
it's rings using binoculars. Through the binoculars we could see 4 of
Jupiter's satellites, Io, Europe, Callisto and Ganimed.

Lauren Oscilowski 9:
Q:What is it like to be in space for 6 months? Do you ever feel sick?

ALEX:
A: We are living in space with Gennady for 4.5 months now. Gennady has
spent approximately the same amount of time in his first mission.
But we are not bored up here - one can work in different roles: as a pilot,
doctor, cook, actor, mechanic and so on - it is very interesting.
On the first days of the mission, a cosmonaut may have the motion sickness
- dizziness, nausea. But we got lucky - we didn't have it.

Emily Comeau 10:
Q: Do you ever miss your family?

ALEX:
A: Sure, we reminisce about our families sometimes. Phone conversations,
video and audio records, letters, arriving with "loadtrucks" (that is how
we name transport spaceships carrying cargoes for us) help us to bear with

the long time apart. With the last "loadtruck" my daughter set me her sewing application - lilac bouquet. I have pinned up in my room next to the "illuminator" (round window - translator's remark).

4628. Date for Berryville, VA hamfest?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 17:21:54 UTC
From: afs@Virginia.EDU
Message-ID: <1993Jul9.172154.18231@Virginia.EDU>
Source record: 279507

If memory serves me at all, I think that there is a hamfest/swapmeet at the fair grounds in Berryville, VA sometime in the beginning of August. Does anyone know the exact date? Please respond directly via e-mail, as I do not regularly monitor this list. Thanks very much.

4629. VE Test Conditions

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 17:28:34 UTC
From: hlester@as.arizona.edu
Message-ID: <QC3DAAC3@mmpc6>
Source record: 279504

Although I successfully passed the Extra Class license elements (hooray!), I am appalled at the noise level allowed at the two separate testing sites I attended. Without mentioning any names or affiliations, I will just say that the first site I attended was virtually a party, with plenty of talking, chatter, and laughing on the parts of both the examinees (who were not, at that moment, being examined) and the VE's themselves.

At the second site the noise was not as bad, but how could any noise be allowed at a testing site? This is an examination, where concentration is required (for many of us!). This is NOT a party nor a place to discuss radio equipment.

Any other experiences? Is this common?

Howard hlester@as.arizona.edu

4630. Re: Anyone know about Atlanta hamfest?

The hamfest will be held at the Georgia International Convention & Trade Center
near the Atlanta Airport south of downtown on I-85. Tickets are $8 at the door.
Talk-in is on 146.82 & 444.825.

The following is from a brochure which I received:

The Central Alabama VE Corps will administer tests both Saturday and Sunday,
beginning promptly at 9:00am. You must arrive no later than 15 minutes before
each session to complete the necessary paperwork. Testing for all clases will
be given. Bring the original and photocopy of your present license, plus any original
credit certification, if applicable, and positive ID. An FCC Form 610 will be provided
at the site. No appointment necessary.

> Is it just me or is the literacy level in amateur really this low?

I crossposted the above because it has some info that might be interesting
to this newsgroup, dispite the writing style (which to me looks more
like the style done on CW, than that written by someone who has no ability
to do real writing). I usually avoid editing crossposts, as I don't
want to chew up another author's meaning, or put words in his mouth that
he didn't say. As long as it's intelligable and of some interest, I
do some crossposting.

(My old English teacher would give me a C minus for the above newly
written stuff! :-))

>> countries. Great Britain and the US have VERY limited 3rd party traffic
>> agreements, and I think that most of Europe is off the list completely.

I suspect that the FCC doesn't really care about the above sceniero(sp).
I think the spirit of the 3rd party rule is that in the case of non-ham
person A wanting to reach non-ham person B in some non 3rd party
country using hams to link up, instead of using the phone company.
Where person A and B know each other before the link-up. DX contests
don't fit this description, as you are making a brief link-up (contacts)
with some random person who you never knew before. You'd never use the
phone company to make similar random "DX" contacts, so the phone companies
don't lose any money over this. So they don't care about these.

4636. Altitude data needed.

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 19:19:47 UTC
From: andyw@aspen32.cray.com
Message-ID: <1993Jul9.141947.27571@hemlock.cray.com>
Source record: 279512

I've created a small (only the state of Minnesota) database
mapping ZIP+4 codes onto 6 character grid squares. While I
have access to the lat/long data, I can't make that directly
available - I thought it would be nice to provide altitude
info, if that was at all possible - does anyone know how
I might locate this information (preferrably on the
Internet) ? It's for a non-commercial ham-oriented database,
if that helps..

A long time ago I applied for a job with "America's Technology Store". I was rather experienced technically, but they refused to interview me because I had no experience in operating a cash register. A technically illiterate friend who had worked in a supermarket got the job. I found a better job.

Radio Shack is in the _sales_ business. Technical knowledge isn't terribly important to them - they did acknowledge the need for computer expertise when they were pioneers in computer retailing, but happily unloaded their experts when computers became easier to operate and a commodity. They can do most sales with no technical knowledge, and the hassles of keeping experts who require higher salaries, can go elsewhere, and often talk back are not worth it to them.

At least they aren't letting kids off the street (with no license) transmit on the HTs any more, at least until they pay for them!

I just passed my tech exam (June 25, '93) and had an EXCELLENT testing session. I got there a little early, but was allowed to take my test anyways. Chatter was ongoing, until.. until.. I was handed a test. The room went DEAD silent. And with traffic coming in an out of the room, the immediate response for someone above a whisper was.. Shhh, he's taking a test! Thumbs up! If you're in the Long Beach, California area and looking to take an exam, leave me mail and I'll send you further details.

Congrats on passing the Extra element, geezzz.. Concentration wasn't a major necessity for my battle with the novice/tech exams, but I sure can see where it might be necessary for the higher exams. By the way, what is the current waiting period for a new license.. I've heard as soon as 5 weeks and up to 3 months.. what is it at now?

>

If I understood the description, the signals can be decoded with an analog
FM stereo tuner - they must be analog signals.

4645. Comment on HW-100 ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 21:17:31 UTC
From: mohan@tulip
Message-ID: <1993Jul9.161732.4746@uoft02.utoledo.edu>
Source record: 279513

Hello,

Today i met a ham who had equipment for sale. Please let me know if the
price is okay.

The equipment is
Heathkit HW - 100, Speaker + Power supply, All manuals.
Heathkit SWR meter , Heathkit Phone Patch, CW Key (very simple model).
Heathkit Balun for coaxial to flat cable, Heathkit VTVM,
and a 80-10 meter dipole wire antenna.

The HW-101 needs alignment. (He said so.)
The price he is asking is $250. What do you people think about the setup and
the price.

Thanks for any info :)

4646. Flooding and Hams m

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 21:31:48 UTC

I was curious what roles the ARES and theNTS were playing in the flood areas along the Mississippi. Also are HAMs active in Mexico with the Hurricane there?

Exactly right. I worked for Radio Hut for two and a half years during
breaks from school, and our store was a bit different than most - Two
engineering students were the sales guys (me and one other) and our
manager was the IL state High School Electronics champion (or
something like that) who had a complete bench setup in his basement.
Needless to say, we spent most of our time taking returns from other
stores on items that were sold under incorrect technical information.
"Well, they said that this would work!" "I'm sorry, sir, but that
straight 12V cord is not going to power your CD player; *yes*, it does
connect from the CD player to the cigarette lighter, but it doesn't
take care of changing the power over."

This summer I finally got a job with Motorola. The only reason why I
worked with RS was that it beat flipping burgers at a fast-food joint
--even though Burger King by me weas offering $5.25/hr when I was
getting $4.25 or 6.75% commission -- whichever was "more" per hour.
(I think that they would have paid us less if there was no minimum
wage law ;-) So, it is hard to keep experts on staff. To be fair,
for most customers, an expert would be almost overkill. (We were told
in one sales class to avoid using "technical terms" and instead use
terms like "the end that plugs into the silver threaded thing on the
back of the TV" or somesuch.)

4648. Two-Line Orbital Element Sets (TLE225)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-09 22:13:43 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.742256023@afit.af.mil>
Source record: 279429
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

> when stuff starts to change in the experiment so does the impedence.

Jonathan-

You have already tried the obvious solutions to your problem. Although the tuners you named may be able to match any load at a given time, I expect they will also be unable to cope with the load changes.

Possible solutions?:

Don't use a tuner. It adds an undesirable reactance after the load has changed. While I don't recommend it, the transmitter's SWR protection circuit can be adjusted to be less sensitive.

Lack of success with the parallel dummy load, suggests that the impedance goes very low. An alternative might be a series dummy load. Why not go a step further, and use a combination series-parallel, also called an "L-Pad" attenuator. This would help remove the effects of load variations on the transmitter output, and would provide a nearly constant source impedance for your experiment.

To implement an "L-Pad", you need either non-reactive resistive elements capable of handling the power levels, or a commercially available power attenuator. In either case, you may need more power, which means an additional amplifier, which means a heavier attenuator.

Back to your experiment. When you say "plasma", I think of gas discharge tubes that have a high impedance until the gas is ionized, and then present a rather low impedance. In use, they are frequently powered from a voltage that is somewhat greater than the ionization potential of the gas, through a series resistance that limits current after the gas fires. How does this compare with the situation of your experiment?

If there is correlation, you could try using the "L-Pad" hooked up backwards, with the shunt element toward the transmitter, and the series element towards the experiment. By judicious choice of resisters, you might be able to avoid an additional amplifier.

73, Fred, K4DII

The Usenet newbie guide suggests editing crossposts, so don't feel
bad about editing crossposts.

Jeff is pointing fun at the reported 20nV sensitivity of the HTX-404.

In <21hml5INNlhs@matt.ksu.ksu.edu> steve@matt.ksu.ksu.edu (Steve Schallehn) writes:
>Are there any repeater systems or repeater networks that use multiple
>transmitters on a single frequency?

San Diego County RACES has a repeater system with 6 different repeater sites around the county all on the same frequency. The transmitters are not synced in any way, you have to take care to bring up only of the repeaters at a time. From the County EOC we can access any of the repeaters giving us a much larger coverage area that we would have with any one of the repeaters.

Does anyone know the story behind the current power struggle in CLARA
that has caused their repeater to go to trash?

For those who do not know what I am talking about, the CLARA repeater
is a very wide coverage 2m repeater in Orange County, Ca. Covers from
Santa Barbara to Mexico, and seems to be the home of the never-ending
QSO. Some kind of power struggle between board members and a control
operator has gotten way out of hand and is now in the courts. I don't
use CLARA's machine that often and I'm trying to catch up on what
happened. It is a most unfortunate circumstance for amateur radio in
this area, CLARA is a good training ground for new hams, and usually
reliable (until now) in an emergency.

Talk about tuning a weird load... I discovered today that the coax braid connection to my 40M dipole was broken by wind-stress. The funny thing is, I was in the middle of a QSO when I noticed that my SWR was infinity - I completed the QSO rather quickly after that. :-) And this was while working Rhode Island from NY with 5 watts... I'll give MFJ one thing - their CW rigs will take a lot of abuse. :-)

Ken,

And that brought about the lead-acid gel-cells that are used in lots of
applications, such as my Sony SPP-75 cordless phone. :)

Here here! I agree with you. Why is it that people think just because a
repeater is there, they can use it? And what's the big deal, he'd be
joining the club so there's nothing to his argument about invasion of
privacy and most clubs I've come across at least want your name,
address, and callsign.

Perhaps if you'd said that in the beginning, this whole thing might not
have started. My 5100 WILL do 50W in x-band but they recommend against
it, same as they do with the 5200.

> Curious Jamie ANDERJH@DUCVAX.AUBURN.EDU

You have to remember that there's alot of bandwidth over the cable and
they use a variety of modulation methods. You can alter the phase of the
signal, and several other tricks (including digital compression of the
signal) and send the info down the line. If I remember right, a cd
samples at 44kHz and we'll say there's at least 5kHz of spacing between
channels for a total of 49kHz per. Take 40 x 49kHz = 1.96MHz without any
compression. That's how they do it.

I failed to find several hundred megs of files, unless you count one single
file that was over 150-meg. Not one that I would likely download.

I went shopping for stuff for HAM-server. I found nothing there that I
thot would be of particular interest to my users. And not indexed, either.

4667. rsgb gb2rs news 11th july

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-10 07:14:14 UTC
From: ted@tedb.demon.co.uk
Message-ID: <742288454snz@tedb.demon.co.uk>
Source record: 279454
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur,rec.radio.info,rec.radio.amateur.packet

Good morning. It's Sunday the 11th of July and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines: We have news of some 50MHz award successes; the RSGB EMC Helpline is no longer needed; and deadlines are imminent for Young Amateur of the Year nominations and for AMSAT-UK Colloquium booking.

The RSGB marks operating successes by sponsoring various award schemes. Among the Society's VHF and UHF Certificates awarded recently was the first ever RSGB 50MHz Certificate to go to the holder of a UK Novice License. This was issued to Pat Williams, 2E1AFN, when she claimed the 50MHz 10 Countries Two-way Award Congratulations also go to Geoff Brown, GJ4ICD, who was issued with the first certificate for having the grand total of 450 squares confirmed on the 50MHz band. If you would like further details of the VHF/UHF award scheme, information sheets and application forms may be obtained from the RSGB VHF/UHF Awards Manager Ian Cornes, G4OUT on receipt of a stamped, self addressed envelope. G4OUT address is correct in the RSGB Call Book.

Due to the success of the RSGB's EMC Co-ordinator scheme and the publication of the Society's new EMC manual, 'The Radio Amateurs Guide to EMC', the EMC Helpline has been found to be no longer necessary. The Helpline will, therefore be closed down. EMC is Electromagnetic Compatibility or in plain English not interfering with your neighbours' electronic equipment, or vice-versa. RSGB members who have EMC problems which they cannot solve themselves should contact their EMC co-ordinator whose telephone number can be found in the RSGB Call Book, and also on page 59 of the June 1992 issue of Radio Communication. If a problem cannot be dealt with by the co-ordinator he or she will call on the advice of a committee member who specialises in that particular type of problem.

Now a reminder that the deadline for nominations for the 1993 Young Amateur of the Year Award is the 31st of July. Full details of this prestigious award, and the associated prizes, can be found in the April RadCom, or can be obtained by writing straight away to the Project YEAR Coordinator c/o RSGB HQ.

The AMSAT-UK Colloquium takes place at the University of Surrey on the 29th of July to the 2nd of August. For reasons of University security, this is an all-ticket event. Anyone wishing to attend this fascinating event, and who has not already booked, should contact AMSAT-UK within the next two days on 081 989 6741.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Cayman Islands, WA6VNR and N6RLE will sign ZF2AH and ZF2JT respectively from now until Tuesday the 13th of July. From Tuvalu, JF2MBF will sign T28JJ from now, until Tuesday the 20th of

July on the HF bands, activity to including some RTTY. From the British Virgin Islands, K8CFU will be active as VP2V/K8CFU from now, until Thursday the 22nd of July, mainly on 20m. From Liechtenstein, a group of French operators will be active as HB0/own-callsigns from Saturday the 17th of July for one week, on 80 to 10 metres, but excluding the WARC bands.

We know of two rallies taking place today, Sunday the 11th of July:

The Horncastle Amateur Radio Electronic and Computing Fair is being held at the Queen Elizabeth Grammar School Sports Hall, Horncastle, Lincolnshire. The event features clubs stands and a bring & buy stall. Catering facilities are available on site, run by the Horncastle Youth Club staff and members. Talk-in will be on channel S22. The Sussex Amateur Radio and Computer Fair is being held at Brighton Racecourse. Doors open at 10.30am. There are trade stands and a bring and buy stall. Refreshments are available and there is also a picnic area close by.

We know of only one rally for next weekend:

The Radio Society of Great Britain National Mobile Rally will take place on Sunday the 18th of July at Woburn Park, near the famous Abbey in Bedfordshire. Leave the M1 via junction 13, whether arriving from the North or South and not 12 as signposted, and follow the signposts to Woburn Abbey. Watch out for the RSGB signs. Do not follow the signs to the Game Reserve or the Wild Animal Kingdom. Doors open at 10.00am. The rally features a large trade exhibition, an RSGB Bookstall and enquiries stand, a BARTG stall and a members mart area all under cover. All the normal Woburn attractions will be available at a small extra charge. Refreshments are available nearby. See July Radcom page 41 for full details and a map of the surrounding area. For further information contact Norman Miller, G3MVV on 0277 225563.

HF contest news now:

The Colombian Independence Contest will take place from 0000 to 2400 hours on Saturday the 17th of July. Contest exchange is the report plus the serial QSO number from 001, on 3.5 to 28MHz. Categories are SSB or CW but not mixed. See July RadCom page 12 for further information. The RSGB Low Power Field Day Contest will take place on Sunday the 18th of July, from 0900 to 1200GMT and 1300 to 1600GMT. This is CW only on 3510 to 3560kHz and 7010 to 7040kHz. See July RadCom page 81 for the power output categories and equipment special conditions

VHF contest news:

The RSGB 144MHz Low Power Contest will take place on Saturday the 24th from 1400 to 2200GMT. It features four entry sections: single operator fixed, single operator portable, all others and short wave listener. The RSGB 432MHz Low Power Contest will take place on Sunday the 25th of July from 0800 to 1400GMT. February RadCom on page 66 has further details of both of these events.

News now of a special event station:

Starting on Thursday the 22nd of July, for six days the callsign GB70CT will be aired by the Loughborough and District Amateur Radio Society. The occasion is the 70th anniversary of the Loughborough Carillon War Memorial, a free standing bell tower 152 feet high. Further details can be obtained from Alan, G0PHT who address is correct in the Call Book. This event is also featured on page 5 of the July RadCom.

And here is the solar factual data

The period from the 28th June to the 4th of July saw an enhancement of the HF bands up to the 30th. This was followed by a collapse to poor conditions due to the passage of coronal holes and a series of M type flares. The largest was an M4.3/2B on the 2nd July. A magnetic sub-storm resulted which depressed the HF bands. The sun spot count has generally declined and meaned at 99. There has been a similar decline in solar flux which averaged 114 units. The geomagnetic Ap indices started at quiet levels but, with the flares, levels climbed to sub-storm reaching 27 units on the 2nd. The period averaged 16.4 units. The state has been 'quiet' then later in the period 'Magstorm in progress'. The radio quality indices improved to very good up to the 30th with the enhancement, then collapsed to poor levels with the 2nd and 3rd being down to very poor on all circuits. For the 22nd to the 28th of June the geomagnetic aa indices ranged from quiet to unsettled. The 22nd and 28th were at quiet levels, down to 9 nanoTeslas, and the 24th and 25th were unsettled up to 47.2. The period averaged 20.6 nanoTeslas. The X-Ray flux has been reasonably steady and averaged B3.0. The sun spot count for June was RI 49.1 with the smoothed index for December 1992 being 73.1+-5.

Now the ionospheric data for Central France:

There has been a series of equipment breakdowns so data this week is not complete. The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 7.2MHz though levels ranged from 8.8MHz on the 29th down to 6.1MHz on the 4th. The darkness hour lows averaged 4.7MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 6.7MHz and the darkness hour lows 5.3MHz. Solar cycle 22 is declining so rapidly that the official forecasting of the ionospheric IF2/12 and the IG/12 spot index is causing concern. The answers coming out based on comparison with previous cycles shows that the rate of decline of cycle 22 is at least ahead by one year. The importance of this is considerable as the basis of almost all CCIR based ionospheric forecasts use these parameters.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way, and no flares are expected. Flux levels are expected to be about the 85s. The geomagnetic activity is expected to be quiet. Ionospheric radio quality indices are expected to be normal based on previous rotations.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T W and G7 O X series, and Novice calls in the 2 0 A F and 2 1 B Y series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

> when your favorite song comes on. These use Titanium, which is a
> type of metal, for the sound. They are on sale at $19.95 till

I had an interesting experiance with my Pro 25s. They sounded great
when I bought them, but after a while, they picked up some sort of rattle
that coninsided with the bass. I took them appart, and found a hair (!)
sitting on one of those state-of-the-art titanium membranes. It looked
like it could have been one of mine... But I don't really know.
I bought mine for $19.95 about two years ago when they were on sale...
I woul guess that they go on sale quite frequently.

Depends on your listening needs. The Yaesu is probably a better quality rig, but there is no expanded receive coverage. If you just want a dual bander for the ham bands, and can afford the extra dollars, the Yaesu is the way to go.

The Alinco, however, with the simple clipping of a red wire under the battery plate, will receive from 108MHz to around 140 MHz (AM or FM), plus extended 440 MHz coverage, plus the 800 MHz- 999 MHz frequencies.

I was faced with the same choice as you only a month ago. I chose the Alinco. 2-meters and 440 chatting doesn't thrill me that much any more, so I wanted a more complete "entertainment center" I am very very satisfied with the Alinco. But be prepared for the possibility of returning the rig for a replacement or for repairs. Quality control is not great. Might take you a second trip to the candy store to get one that works properly.

You are completely wrong. I purchased two FT530's this year, one with/for
a friend, and the other just last week for myself. A very simple solder
jumper controls extended coverage receive and transmit. Once modified
the radio VHF and UHF coverage is considerably extended, and 800-950
reception is enabled as well.

The only drawback is that 12.5Kc step is the _only_ option in the 800-950
band. :(Bummer

I also have an Icom IC-W2A which is a wonderful radio (probably better
as a radio than the Yaesu) and is available for the same price as the
FT530. I got the 530 for it's great remote control LCD display speaker/
microphone and power saving features.

Not quite correct. I own a Yaesu FT-530. There is a mod (it's been posted
here several times in fact) for it that will allow it to receive the
frequencies that you listed above, as well as a few others. (300-500 Mhz comes
to mind immediately.)

>very very satisfied with the Alinco. But be prepared for the possibility

The possibility of problems with the Alinco was a big part of why I bought
the Yaesu. I played with both radios for quite a while before I bought one. I
just liked the way the Yaesu felt and the way the controls were layed out on it
better than I liked the Alinco. The fact that the Yaesu was less expensive
didn't hurt either. :-)

I found it to be very slow as well, My bet its a dialup ppp/slip link.
>
>So, can anyone tell me what the files ham.nfo (153 MB), hamcall.129
>(91 MB), hamcall.all (124 MB), and stations.149 (89 MB) contain?
These are "buckmaster" file names for various parts of the callsign
database. hamcall.129 is US callbook in fixed field legnth ascii
format. hamcall.all is an encrypted US calls + DX calls., stations
is various zip code, lat/long county info.

>KB7IHO

There have been hams active throughout Bosnia-Herzegovina since the start of the war. In fact, in many besieged Bosnian communities, hams are the ONLY source of information -- the ONLY link with the rest of the world. Hams have passed thousands of messages in and out of Bosnia, so people in the rest of the world could find out if their loved ones in Bosnia are still alive. Serbian forces have cut regular phone lines in and out of most of the territories they are besieging (although in some cases phones within those cities still work, it is impossible to call in and out of those cities).

Ham-radio reports are also the only way that international relief agencies have received news of conditions in besieged "safe havens" (a sick joke, they are probably the most miserable, dangerous places in the world right now) such as Gorazde. There have been numerous references to these ham-radio reports in news stories about the war.

Most of the health and welfare traffic has been done by other European hams, particularly in the rest of what is/was Yugoslavia -- that's where a large number of people with family still in Bosnia are located, of course. In addition, many of the Bosnian hams simply cannot run the kind of power or antennas needed to reach the States -- particularly those operating from Bosnian-government controlled territory, where electric supplies have been very sporadic. They are operating under imaginable conditions, often right near the front lines when Serbian gunners are trying to look for and destroy their antenna systems, their stations -- and them. :-(Their efforts to keep lines of communication open have been absolutely heroic.

Hams from Bosnia-Herzegovina are still occasionally heard here in the States. About a month ago, there was electricity in Sarajevo for several hours a day for almost a week, coinciding with very good propagation conditions. There were a number of hams from Sarajevo working Stateside stations that week. Now, if you have been following news reports, there is almost no electricity at all in the city -- even the hospital is virtually out of generator fuel, so patients are dying because life-support equipment cannot operate; there's almost no power left for water pumps -- there is no running

water at all, so people must walk miles and wait for hours to get their allotted half-gallon of water each day (in near 100-degree heat, this is all they may have to drink and try to clean themselves, clothes, etc). Under such conditions, it's hard to imagine there is any kind of spare electricity available to power radio stations or packet. However, even if a ham managed to connect to a car battery and get on the air, (s)he could not help with passing health and welfare traffic -- the breakdown of emergency electricity supplies has shut down the local telephone switching station, so none of the local phones are working. Even if someone could contact a ham in Sarajevo, that ham could not then place a phone call to get information for you.

By the way, the needed diesel fuel that would meet Sarajevo's emergency electricity needs -- for the hospital, water pumps, and telephones -- is sitting at the Sarajevo airport, blocked by Serbian forces; despite the U.N. mandate allowing "all necessary means" to get humanitarian aid through, the U.N. is simply waiting for Serbian permission to allow the fuel in. Anyone reading this who wants to help our Sarajevo colleagues get back on the air might consider contacting your government, your government's mission to the United Nations, and U.N. headquarters in New York to call for stronger action to get that desperately needed fuel into the city.

Assuming, as I hope and pray, some electricity is restored to the city soon and hams are back on the air in Sarajevo, U.S. hams must keep in mind third-party traffic rules. Although it seems totally ridiculous to me that such things apply in and out of war zone; technically, it is still not allowed to pass messages on behalf of a non-ham here for a non-ham there. But there are a number of way around this. For example, according to an FCC official, it is perfectly legal to tell a ham there "I am seeking information about so-and-so," so you can at least find out if the guy's family is OK. Or, you can enlist the help of a ham in Europe who can legally pass 3rd-party traffic in and out of Bosnia -- if that ham were also on Internet, for example, you could pass the messages in and out of Europe that way, with only the European ham using ham radio.

If the guy's family is somewhere besides Sarajevo, there may still be hams on the air. As I said before, very few of them are audible here in the States; but many more are active on 40m and 80m passing messages. Perhaps someone in Europe who reads this is active doing this and might be able to help you; or, I suppose, you could put out a message to a few European packet BBSs asking for help.

Good luck.

Re: the FT-5100 / FT-5200. PL decode is a very, very good idea if
you live in a large city. That is, unless you like to hear lots of
bing-bong-da-da-da-da... from pager supurious and intermod.

Both the 5100 and 5200 have too wide a font end to avoid pager
intermod.

My power meter seems to suggest that the 5100 does ~40 watts on 2m
and about 35 watts on 70cm when operated in crossband repeat mode.
The PL decode is very useful in this case. Yes, you can
make a band reject filter. It isn't very diffiuclt, but does
require doing some real math and actually picking up a soldering
iron. It Depends on whether you like to talk or tinker which solution
is best for you.

Source record: 279449

I have the Icom car cord for my IC-24. It has just a choke and a capacitor. I once used a direct cord and got complaints that my TX was noisy, but had no RX problems. I've used the Icom cord in the same car and had no problems.

I leave the battery pack attached while using the radio in the car.

If Rat Shack has a filtered 12 volt cord it probably would be sufficient. Be sure to watch the plug polarity carefully.

I have a collection of HTs. I still feel the 24 is one of the better units on RX sensitivity and freedom from front end overload. The simultaneous dual band RX on other HTs is nice, but none I've seen equal the performance of IC-24.

Source record: 279452

My pick would be the Yaesu FT-530 over the Alinco DJ-580.
Apparently, the cost differential is not the primary concern on
your shopping list.

The FT-530 most certainly can be modified to cover GMRS and 800-900
frequencies as well as MARS/CAP for receive in all and transmit in
appropriate bands. If you get the 530, call Yaesu at the phone
number in the manual and have them fax or mail you the mod sheet.
It is quite easy; only involves changing some solder bridges inside
the radio. The 530 mods are also available at assorted FTP sites.

If you really want MARS/CAP stuff, you might take a look at
Standard HTs. At least some models can be programmed from the
keyboard via an abstruse ~25 keystroke sequence to add MARS/CAP and
other coverage. I've got a C528A which has been expanded. I don't
know about the other models. So, if you are averse to
disassembling your radio, consider these. Consult with your vendor
for available mods.

One nice thing about the Yaesu 530 is that it has a pretty nice
clearly written manual. That is something to think about if you
want to easily make use of all those complex features for which you
bought your HT.

Ooops! Sorry for the bad information on the Yaesu FT-530. Indeed it can be modified for extended coverage. The folks at the candy store should have known that, and should have advised me accordingly when I was deciding between it and the Alinco. The Yaesu was only $25 more than the DJ-580. I just wish Yaesu had mentioned the possibility of expanded coverage in their brochure.

>the first site I attended was virtually a party, with plenty of talking,
>chatter, and laughing on the parts of both the examinees (who were not, at
>that moment, being examined) and the VE's themselves.

Radio-Club-itis. Bet you'll find the chatty folks are the same ones that chat through club meetings and movies and all that. The problem seems to start during that time after registration and until the exams come in to be graded. these folks have nothing to do while they are waiting so they start talking about the next field day or the dx contest or who they worked on the satellite etc. in some cases, these same people behave exactly the same way when involved in things like marathons or parades or other communications work - and you try to have a meeting to organize things that turns into a meeting where the chair cannot control the floor.

i know i've had people complain about my desire for a rigorous approach to running an exam session but those also go faster and you get done quicker than the "relaxed, friendly" atmosphere that some would have. I don't work well in those environments since it's too easy for me to get wrapped up in a side discussion and fail to observe the testing.

>At the second site the noise was not as bad, but how could any noise be
>allowed at a testing site? This is an examination, where concentration is
>required (for many of us!). This is NOT a party nor a place to discuss radio
>equipment.

you are correct. you should make a request of the examiners (if you can get their attention to do so) to knock it off. it's very easy to get tied up in "radio-club-itis" without even thinking. since i started doing liasion work with the group here, i have noticed there are pairs and triples of examiners that seem to be more prone to this behavior than others. it can help if the VE team has members that have hearing loss requiring the VE team to talk at least at "normal" levels instead of whispers.

there are, however, reasons the VE team will need to communicate with each other so it's not qoing to be absolutely quiet once things begin.

i think it was about 4 or 5 months ago that we had to have a bad "combination" do one of the groups (novice/tech written exam, 2nd room has everything else). if i remember right, the VEs had all just gotten back from extensive trips in the last week and they wanted to talk about their travels...almost couldn't get a word in edgewise.

>Any other experiences? Is this common?

VE teams have to stay focused on why they are there. got to drop discussions about the repeater and the club and all that -- it might help if there's a VE net the night before the exam such that the VE team can get all the discussion out of their system the day before (a lot of the chatter seems to be "good to see you - haven't seen you since last month -- how's it going?" stuff.).

if time permits, meet at a McDonalds or something and have a breakfast/dinner meeting before going to the exam room to get the examiners "talked out".

4688. Antenna/IC-730/Condo

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-10 21:12:32 UTC
From: badbunny@tfsp.saic.com
Message-ID: <9307102111.AA02775@tfsp.saic.com>
Source record: 279461
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.shortwave

Note that I do not necessarily have access to the newsgroups (I'm posting via a gateway) and I'd much appreciate it if any replies were CCed to badbunny@tfsp.saic.com. I apologize for any ill will this may cause. Also, remember to follow up ONLY to those newgroups which relate to your post...

Howdy,

I currently have an IC-730 that I inherited from someone (he let his license run out...), and I wanted to get some antenna recommendations. Currently, I'm a Technician who has not passed/taken the code test. I've played with packet radio only so far, and thats been interesting. I'm not too into VHF voice...

Anyway, I'm look for an multi-band antenna (approx 80-10m, but 40-10m would be a good start). For right now I'd be using it for shortwave listening/ham listening, but I'd prefer it to useful for transmitting in the future when I upgrade my license. So it has got to be able to pick up more than just the amateur bands. There are a few broadcast SW stations I'd like to listen to (various BBC broadcasts and Radio For Peace International in Costa Rica).

So, I'd like to get an antenna that fits the following constraints and the above description:

a) I live in a condominium, so its got to be an inside antenna. (Dow!)

b) I have access to the attic (its the standard triangle roof), so I can string up wires, etc. The center of the attic has pretty much an 8 foot clearance, floor to ceiling. If worse comes to worse, I can experiment with installing a vertical antenna non vertically.

I'm located at the top of a big hill, so I've got pretty good access to to the airwaves.

Any recommendations? I am within driving distance from EEB in VA, so I might be able to make a road trip out to there next saturday morning. Also, references to books, etc that would help me figure out how to deal with the local condominium rules about external devices would be a plus too.

Thanks,
Brendan - KD4YJS

PS - is the IC-730 a good general purpose HF transceiver? Can anyone point me to a review? I don't have the manual, etc. It seems to be able to tune to some of the SW broadcast bands, but since I have an antenna for it, I have no idea how well it picks up signals in those bands.

One factor not generally known to non-VEs is that the rules require
that there be three VEs in each room where testing is taking place.
Thus, to have a separate code room would require six VEs.

I have seen sessions where the code-takers wear headphones, and that
can obviously help a lot.

!!But in the UK *any* person with any sort of amateur licence is not considered
!!to be a 'third party'. So I can quite happily let a VHF-only licensee use
!!my HF station under supervision ('supervision' is not particularly well
!!defined in the UK licence :-)) I think recent changes even allow anyone
!!who has passed the relevant exams and who isn't barred from holding a licence
!!to operate without being a 'third party'.

!! Dave

****

I don't think that "NoCode" licensees should be able to do any HF operation in the US. If they want to, they should learn the code. I had a really hard time with the code at first, and i mean a **REALLY** hard time, so I can sympathize with those who have truoble with it. But after a lot of practice, a *LOT* of practice I passed 20 WPM (without simply guessing at the mult choice).

Which could certainly be a problem for the smaller VECs.

>I have seen sessions where the code-takers wear headphones, and that
>can obviously help a lot.

Even better is one where there are slaved oscillators for each test
postition. The Sunnyvale VEC uses these, and they allow each person
to adjust the volume and pitch to hir desire. Which is a convenient
way, by the way, to short-circuit the "I can't hear certain tones"
excuse for not taking the code test; sie can pick any tone that
works. That scheme doesn't work for deafness, though.

I'm not entirely sure how the little boxes work, but I don't think
they cost very much. I could get further details by hassling one of
the VEs who I am acquainted with.

RACESBUL.282 DATE: July 12, 1993

SUBJECT: OPS - Communications Shortfall - Part 2/2

"OES is working in several areas to remedy this shortfall:
the Operational Area Satellite Information System (OASIS) is in
the installation phase. This system will result in situation
reporting that is more timely and accurate. The implementation
of Senate Bill 1841 (Petris) will result in a standardized system
for emergency management. This will involve components already
known to be effective such as ICS (Incident Command System), MACS
(Multi-Agency Coordination System), the Mutual Aid systems and
the operational area concept. Even with successful implementation
of these projects, each organization and individual involved in
emergency management needs to examine these issues from their own
perspective. What can be done to ensure the most timely and
accurate damage assessment? How can we ensure that responders
and decision-makers can communicate with all those they need to,
when they need to? How can we ensure that each entity and
individual involved works with others in a manner that is truly
coordinated? Each of us needs to answer these questions this
year."

4695. Info on Alinco DJ120 HT ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-11 01:06:26 UTC
From: hudson@ualr.edu
Message-ID: <1993Jul10.190626.1@ualr.edu>
Source record: 279471

--

I recently obtained an Alinco DJ120 HT, without a manual. I think I have
figured out most of the features of the unit and basically how to use them,
but I'm not sure on a couple of things. Does the 120 have scan capability?
Is the numeric keypad only used for touch-tone generation? What is the
"call" button for on the top of the unit (I found that it takes you direct
to memory "0")?

As best I can tell, the specs are something like:

10 memory channels, which can be locked in.
capable of operation from 133 MHz to about 173 MHz
Power out about 2.5 watts

Is that about right? Thanks to all for any info you can share, especially
if you have an extra manual around, or copy???

Thanks,
Keith

Hello,
I am looking for some info on the Texas Bugcatcher.. Any users out there?

Does it work?
How does it work?
Is it multiband?
Does it require a tuner, amd will automatic do it?
Where can I get one and estimated price?

I'm testing the waters for a good antenna for a confined space and this
one has been suggested but no one seems to have any info on it.

Thanks in advance for any responses !! 73 .. Todd.

4697. SWR!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-11 02:20:36 UTC
From: ODONNELLP@MAR65.MAR.ORA.FDA.GOV
Message-ID: <930710222036.7fea@MAR65.MAR.ORA.FDA.GOV>
Source record: 279469

Hi All,

This discussion is pretty much a favorite for us hams, isn't it?
It never ceases to amaze me how much inaccurate "advise" creeps into it
over time, and all the popular misconceptions that are "accepted". But
guess thats why its such a good topic, huh? At any rate, I'd like to
present some thoughts for consideration, and in a way I hope it helps
to disuade some of the erroneous chatter.

We all have our favorite antennas, and real world stories and
experiences that influence our feelings, etc. Sometimes though we tend
to forget that theory stuff we had to learn, and sooner or later we get
burned by it too! We all have at one time or another, right? Also, as
in much of the English language anyway, it tends to be somewhat imprecise,
and popular usage (note that that usage doesn't make it accurate!). For
example (my pet pieve!), it has become common knowledge (even if it IS
WRONG!) that resonance, when we're talking about antennas, means the
point of lowest SWR!! That is clearly wrong, but most hams seem to
accept it as such (and that is the central point of this discussion).
Jim Bach, WY9F, said it well:

>>The wire antennas I run are at 25ft, and were cut to "resonance"
>>using a grid dip meter when installed. SWR stunk, and found that I
>>had to "cut down" the lengths a bit to get them to appear 1:1 at the
>>shack!

Notice that Jim did not say what type of feedline he was using. If
he used RG-11 instead of RG-8, would that change the resonance of the
antenna? Absolutely not! But would the SWR be different? You betcha!
Would either one be wrong to use? Absolutely not!

Consider this: the discussion at hand is really revolving around
three central topical areas; the ever popular SWR, resonance, and that
dirty word most of us don't relate to very well, impedance. They are
all very closely related, and one may affect another, but no one of them
could be regarded as equivalent to any other. We deal with all of them
in each and every antenna we choose to use, like it or not. Resonance
does not mean low swr, or low impedance. Nor does it mean the opposite.
Whether an antenna is resonant or not, it can be made to be an
effective radiator! Just ask your local AM radio station engineer!
Or the guy that shunt feeds his tower on 160.

Resonance, by definition, means the frequency at which the antenna
accepts the transfer of power easiest and RADIATES most efficiently.
Thats how Jim's grid-dipper found the "resonance" of his wire antenna.
When he tuned the dipper to the antenna's resonant frequency, the

antenna sucked the power right out of his dipper, and it stopped oscillating!

After all, radiation, not SWR is what an antenna is for, isn't it? Any resonant antenna can be fed by essentially any type of feedline, but of course, the matching devices may need to change. For practical reasons, we often choose to use NO matching device at all, and feed an antenna directly, such as the popular inverted vee. Is that wrong, or bad? No. But it can cause trouble. Is it easier? Sure, and thats why we do it that way.

Now SWR. To quote from the ARRL Handbook, " Whatever the application, the conditions existing at the load, and ONLY the load, determine the standing-wave-ratio on the line." Period! Pretty simple, huh? But I wonder how many of you have, like me, wasted hours working on that wiz!2@#$% antenna, and forgot or lost the sense of this one! Actually, it really is THAT simple, but we humans (as usual) just have to make it more difficult on ourselves, right!? Who was that sage that wrote "nothing worth doing comes easy", and boy do we work at making that true more often than not!

Actually, its usually a matter of practicality that sets the trap. I mean, its certainly easier to de-tune the antenna (lengthen or shorten it to change its IMPEDANCE) to lower that dreaded SWR, at least on wire antennas. Doing so, of course changes the true "resonance" of the antenna, but who cares if it radiates well. The result tho' is a "resonant" system, and probably not a resonant antenna in the truest technical sense. Which, is fine for most of us, most of the time. If it works well, then that was the goal, right? But that doesn't mean what some of us say.

What I mean is, if 7.037 is where the lowest SWR is measured on your zip-dogged-gone framitz antenna, that is likely NOT where it is actually truly "resonant". It doesn't mean the antenna is no good 'cause its not. Especially if it works! I guess its just easier to say "my antenna's resonant at 7.037" and not the "the lowest SWR is at X.XXX". Thats what I meant earlier when I said "popular usage". By saying "my antenna's resonant at" seems to be accepted as meaning the "lowest SWR is at" so-and-so frequency. They really don't mean the same thing at all! But, popular usage has re-defined the terms, which is precisely why this discussion is going on right now.

Commercial antennas often do the same thing, so why shouldn't we? The popular VHF beams often have the "resonance" well out of the ham band the antennas were designed for! What you say!? Well, they do it on purpose typically to improve the radiation pattern or raise the driven element impedance to something easier to match to 50 ohm coax. But then the true "resonant" length of the driven element is out in space somewhere. So what! But thats still its real RESONANCE, or some will say, its free space resonance; whatever that means. I'd like to know where they find "free space" anywhere, HI!

Anyway, whats important in all this is to understand the difference and relationships involved. 'Cause if you don't, you can really get into the soup. You can feed any type antenna with any feedline if you have the skills and material to design and build an appropriate matching device. Which means, you can make the SWR whatever you want it to be. By de-tuning the antenna (which means changing its RESONANCE) and thus its IMPEDANCE at the frequency you're interested in using it on, to get the desired SWR on the feedline you happen to choose to use. That just happens to be the most popular way. It can lead to trouble tho'. Too much de-tuning can turn a good antenna into a dummy load in the sky, even if the good ole SWR-bridge says 1-->1! Understanding the relationships can prevent that from happening, or help you resolve it if it does, and thats really the message.

AMSAT JOURNAL HAS A NEW EDITOR

HR AMSAT NEWS SERVICE BULLETIN 191.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-191.01

The AMSAT Journal Has A New Editor

AMSAT VP of Publications, Drew Deskur (KA1M), has announced the appointment of John Hansen (WA0PTV) as Editor of The AMSAT Journal. John takes over the Journal from Dr. Paul Urie (N7QOC). N7QOC, a surgical pathologist and has recently taken on more responsibilities at his job at the University of Utah at Provo and has found these new responsibilities prevent him from spending the time required to publish a quality publication.

WA0PTV, a long time AMSAT member, has been on the Editorial Staff of The AMSAT Journal for a number of months and has shown a keen interest in stepping up into the post of Editor. WA0PTV is the head of the Economics Department at the State University of New York at Fredonia. WA0PTV intends to focus on keeping the Journal a high quality publication, work at improving the distribution schedule, and look to find ways reduce the financial burden the Journal places on the AMSAT budget without reducing the quality.

WA0PTV would like to remind anyone interested in the Amateur Satellite program that the Journal is always looking for manuscripts for articles at all levels. Construction projects, operating aids, investigation into interesting phenomena all make good topics for the Journal. Manuscripts should be sent to WA0PTV home address at:

John Hansen (WA0PTV)
49 Maple Ave
Fredonia, NY 14063

You can also send your manuscripts to WA0PTV to his INTERNET mail address: wa0ptv@amsat.org. See page 3 of any AMSAT Journal for details on preferred format for article submission.

AMSAT would like to thank Dr. Paul Urie for the time and energy he has put into The AMSAT Journal over the past year. As is the case with all AMSAT volunteers, Paul gave freely of his time and talents and we wish John Hansen luck with his new responsibilities at his job.

Washington, D.C. Area AMSAT-NA Group To Meet

You are invited to attend the next semi-annual meeting of AMSAT members local to the greater Washington, D.C. area on Saturday, 17-JUL-93 at 1 P.M. EDT. The meeting will be held in the lobby area of the Intelsat Headquarters Building at 3400 International Drive in Washington, D.C. All topics relate to amateur radio and the amateur space program. The format will be a combination of presentations and informal "show 'n' tell" demonstrations. Advanced registration is not required for admission but it is necessary for each presentation or demonstration. Talk-in is on 146.910 (-) MHz FM. An agenda, directions, and other information can be obtained from Pat Kilroy (WD8LAQ) at (301) 731-8695.

BID: $ANS-191.03

AMSAT Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz.

Date UTC Mode Phs NCS Alt NCS

17-Jul-93 1530 B 64 VE2LVC W9ODI
24-Jul-93 1930 B 70 N7NQM W5IU
31-Jul-93 1300 B 98 WB6LLO WA5ZIB

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on immediately after the OPS Nets a downlink on a Mode-B downlink frequency 145.960 MHz.

SILVER SPRING, MD JULY 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-191.04

Weekly OSCAR Status Reports: 10-JUL-93

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Jul 10-24
Mode-B : MA 0 to MA 25 !
Mode-S : MA 25 to MA 40 !<- Mode-S transponder; B Transp is OFF
Mode-B : MA 40 to MA 256 ! Attitudes Jul 10 140/0
Mode- : MA ! Jul 17 145/0
Mode- : MA ! Jul 24 150/0
Omnis : MA 170 to MA 15 !
Please do not uplink to Mode-B between MA 25 through 40 as this will QRM the Mode-S users. Don't rely on gossip and rumor! Continuous up-to-date information about AO-13 operations is always available on the beacons on 145.812 MHz and 2400.646 MHz in CW, RTTY and 400 bps PSK. Also, these bulletins are also posted to INTERNET, ANS bulletins, Packet, PACSATs, etc., and can also be found in many international newsletters.
[G3RUH/DB2OS/VK5AGR]

RS-10: The Mode-A transponder is working fine with good downlink power and telemetry. The best passes seem to be in the morning due to 10M openings later in the day. RS-10's Mode-A transponder passband frequencies are:
Uplink 145.860 - 145.900 MHz
Downlink 29.360 - 29.400 MHz
Beacon 29.358 MHz
Robot 29.403 MHz
About 25 watts EIRP is all that is needed inorder to put a good signal into RS-10. Also, this is a very easy bird to work while you are mobile.
[WC9C]

AO-16: Operating normally. [WH6I]

UO-22: Operating normally. [WH6I]

KO-23: Operating normally. [WH6I]

FO-20: FO-20 continues to provide excellent service in both the digital (Mode-JD) and the analog (Mode-JA). The analog transponder is only available Wednesdays (GMT), with digital operations the remainder of the time. On all passes towards the end of the week there was a noticeable decrease in stations on the users list that were connected during LOS. Most users listed were active on the satellite. Currently, there are a few NODE stations operating that provide access to FO-20 using standard AX.25 packet stations. Use of these NODES has increased the number of users on FO-20, and allows packet operators experience on digital satellites without the expense of additional equipment. Information on setting up a NODE station is available from AMSAT Headquarters. [N0NBH]

ARSENE: JH1AOY would like to provide a ARSENE Mode-S equipment list for those wondering what his station consists of:

1) Mast mounted down-converter from 2446 MHz to 144MHz. The model
UX-2400-OS(ARSENE) HEMT version from MAKI DENKI (ELECTRONIC)
which is made in Japan.

2) Mast mounted pre-amlifier is model ERB-2400BGXH purchased from ELIET
MUSEN (RADIO) made in Japan. ERB-2400BGXH has a Noise Figure (NF) of
< 1.0 dB, GAIN > 25 dB.

3) JH1AOY's antenna is home built 2 meter diameter parabolic dish with
a focus diameter ratio of 0.5 and 2.5 turns helical antenna feeding RHCP.

JH1AOY evaluated ARSENE's Mode-S signal level with that of with AO-13's
Mode-S. When using sun noise as the basis of comparision, he found that
AO-13's Mode-S signals were over 10 times stronger than the sun noise.
However, ARSENE signal had about the same as the sun noise or less than sun
noise. [JH1AOY]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

/EX

Actually I'm surprised they did that. The other night I participated as
a VE in a local session and we ran all the code FIRST. If anyone wanted
to take a written while the code was going on they could.

SB DX @ ALLBBS $OPDX.119
Ohio/Penn DX Bulletin No. 119

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 119
BID: $OPDX.119
July 12, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, K4CEF & Southeastern Cluster Group, DL5DCM, DF8AN, DL8AAM, IK5ORP, JE1CKA, SM5MX, AD1C, N5FTR, AB6MP, KQ8M, KF8VW, K8YSE and K9AJ for the following DX information.

4U1ITU, ITU HQ. Mike, DF8AN, will be active from ITU Headquarters in Geneva, from July 12th to the 16th. Activity will be on the usual DX frequencies 10-160 meters. QSL via the German Bureau or direct to: Michael Noertemann, Amselstieg 4, D-38226 Salzgitter, Germany.

5A, LIBYA. Where do you begin reporting on this one? With all the rumors and speculations, it makes it hard to decide what to report and what not to report. So just remember, nothing has been officially announced or reported (everything is rumored!).
There were many disturbing reports early in the week about Romeo and his 5A0RR operation. These reports are from several different sources, but Ed, NT2X, has been the best and reliable source. The latest information available indicates that Romeo is being detained by Libyan authorites.
There is some confusion on the status of the other operator, Ognyan, LZ2UU. First reports in the beginning of the week indicated that LZ2UU was release by the authority and has returned home. But just before the weekend, this information was changed to "LZ2UU is still in Libya with Romeo".
Ed, NT2X states, "I am asking the DX community to be patient and understanding at this time when facts are hard to come by. I also ask DXers to be careful and not to jump to any conclusions, regardless of what they may hear. My friends and myself will continue to seek reliable information on Romeo's current situation, and will make it public when we know the facts." (ed. Remember, there has been no verification on these rumors/information.)

5H, TANZANIA. As reported last week, Simon, G0GWA, would be active from here for 3 months, but Simon was uncertain what call sign he would be using. He is now active as 5H3FOE and was heard on 14016 kHz around

2330z.

5U7M, QRT SOON FROM NIGER. Yoshi, 5U7M/JH4NMT, who has been active since early 1992, will be heading back to Japan at the end of July. His activities will end after the IARU Contest.

BT2000BJ, CHINA. A special event station will be active from the Tsinghua University Amateur Radio Club, BY1QH in Beijing, during the whole month of July. The call sign of this special event station that will be "operated in support of China's bid to host the Olympic Games in the year 2000" will be: BT2000BJ. BT indicates a special event station, 2000 speaks for itself and BJ stands for Beijing. BT2000BJ will be active until July 31st. The station will operate mainly from 1200-2200z on SSB (w/16 operators), RTTY including AMTOR (3 ops) and CW (1 or 2 ops: DJ7BU and SM5MX, work permitting). Activity will be on 40-10 meters, including WARC bands. QSL via BY1QH, P O Box 2654, Beijing 100084, People's Republic of China.

C9, MOZAMBIQUE. Craig, ZR6REV, and Keith, ZS6KTT, will be spending 10 days in Inhaminga, 200 km north of Beira in Mozambique to refurbish a hospital which was damaged during the civil war in that country. The mission is under the auspices of World Outreach Ministries based in Midrand. They will be on the air by July 11th. The callsigns to be used are C93BB and C93BC. Activity will be on HF, 2 meters and 6 meters. QSL to P.O. Box 321, Halfway House 1685.

CY9, ST. PAUL ISLAND. By the time you read this, the group active from here will probably be QRT. The CY9 operators were heard saying that they were planning to depart Monday morning (12th July) at 1030z. They also stated that the vast majority of contacts were made on 20 meters with only one QSO on 15 meters with a D2 station. But if you miss this one, do not worry. CY9CWI will be active August 14-18.

HB0, LIECHTENSTEIN. Anne, DL5DCM, and Martin, DL6DCM, will be active from July 26th to the 30th. They will be on 20, 15 and 10 meters SSB only, but they may also be active (depending on the conditions) on 80 and 40 meters. Their call signs will be HB0/DL5DCM/P and HB0/DL6DCM/P. A specially designed QSL card can be obtained via their CBA.

V31, BELIZE. Buzz, N5FTR, informs OPDX that his brother Al, WD5IQR, and their mother Bobbi, KA5BOA, and himself will join Dave, P29BT/N7BTK, for a week long operation beginning August 9th thru the 16th. Activity will be on 10-80 meters using CW, SSB, RTTY and PACTOR. The callsign of the group will be V31BR and the operation will take place from IOTA NA-073. Anyone needing a YL contact from V31 will be accommodated by Bobbi. QSL via N5FTR.

VP2M, MONTSERRAT. There will be a YL DXpedition to here starting July 25th thru July 30th. Opertors Janet/AB6MP, Gayle/KM6WF, Nancee/N6ZRB and Ellen/N6XJM will be active on: CW - 21150 and SSB - 3900, 7250, 14250, 21350 and 28350 kHz (subject to QRM and conditions). Call signs were not mentioned or QSL routes.

YJ, VANUATU. Ron, ZL1AMO, is now active as YJ0ARW. He was heard on 7005 kHz around 1130z and 14088 kHz at 1230z (RTTY). Also check 30 meters around the same times. His length of stay is unknown.

ZS8MI, QSL ROUTE ADDRESS CHANGE. QSL via Christie De Kock, PO Box 244, Stellenbosch, 7599, Rep. of South Africa.

ZX0ECF, ANTARCTICA. Mura is active from the Brazilian Antartic Base of cap. Ferraz. Mura can be found every Monday, Wednesday and Friday on 14330 kHz at 1900/1930z (for a short time, about 10/15 minutes). During the weekend, Mura is active on 28530 kHz (early afternoon) if the band is open or on 21223 kHz. He will be there until December of 1993. QSL to: Estaciao Antartida Comandat Ferraz, Agencia Correio Satellite, Antartida, ZIP CODE: 20201/970 Brazil.

PREFIX CHANGES. The French PTT has changed their call sign structure as follows:
FA xxx -> no change FE5xx -> F5xx
FB xxx -> no change FE6xxx -> F6xxx
FC1xxx -> F1xxx FE8xx -> F8xx
FD1xxx -> F5xxx FE9xx -> F9xx
FD6xxx -> F6xxx F1xxx -> F5xxx
FE1xxx -> F5xxx FF#xxx -> F#KAA-KZZ (Club Stations)
FE2xx -> F2xx F1 -> CEPT License VHF
FE3xx -> F3xx F2-F9 -> CEPT License HF

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Hello,

Is it possible to use a Kenwood Automatic Antenna Tuner used with a TS-430S,
for the older generation Kenwood TS-520S or transceivers made by other company
like the Yaesu. ?

Please let me know of your experience rergarding the above.
Thanks for the info.

When testing for my tech recently, I experinced some of the 'fellowship'
of ham radio. One guy had come with his wife, who was going for her
ticket. He wanted to to take the 20 WPM code test just for practice. The
VE's said that that they couldn't do that - and suggested that he just pay the
$5 and go for it. He was reluctant, because he said he wasn't ready. Pretty
soon everyone in the room was hollering for him to 'go for it' - kinda
sounded like a game show! He finally did go for it and passed! He walked
out of there with his extra - and a mild case of shock...

Yeah, (I passed my adv & gen tests at the above ve session), and most of the other sessions I know about around here (in RI) do the same thing. Code and theory are done seperately, but u can do ur test during the code IF u want to, or at the end of the code tests. Since I had to take 2 theories, I did them during the code to save time.

4708. Kenwood TH28 intermod problem.

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 00:47:25 UTC
From: llwest@triton.unm.edu
Message-ID: <21qcatINNeqn@lynx.unm.edu>
Source record: 279380

I am trying to help a friend who bought a used TH78 dual band HT.
The thing was modified for out of band transmit so he could use it
while hang-gliding. It seems to be VERY sensitive to intermod, and
will not function at all when near the radio towers we have on the
east side of town (which also happens to be the best place to hang-glide).
Any suggestions ? Is there a fix for this problem ? There are others
who use Alinco DJ1FTs and kenwood th25s without as much of a problem.
Is he just up the creek without a usable HT ? Any information will be
greatly appreciated. Any info on other mods or de-mods that would
reduce the intermod ? :-)
Thanks.
larry

4709. 6 meter HT's?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 01:10:40 UTC
From: jfh@netcom.com
Message-ID: <jfhCA11xt.5ss@netcom.com>
Source record: 279381
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Does anyone have experience with the Azden 6-meter hand-held? I know someone who tried one and sent it back, but my tastes might not be his.

Does anyone else make a 6-meter HT? What's the price range?

Can the Azden unit be modified to broadcast on 47.42? Are there any units which would be type-accepted for that frequency and also able to use the ham bands? (That might require a modifed commercial radio, which would probably be too expensive.)

To any hams who are Rush fans:
I happened to hear a new net on 20 this weekend. The mega-ditto
net meets each Monday at 0000z (2000 EDT on Sunday) on 14.250MHz.
The NCS is KI7EA in Washington state. He said the net may also
be on 14.260 if there are problems with 14.250.
The stated purpose of the net is to discuss issues of interest from
the show. It lasts for 1 hour.

Phil

So if I were visiting Australia and could pass the test there, I could get
a VK call which I could use anywhere in the world except in areas regulated by
the US FCC? No requirement to be a citizen or resident?

Which countries are in the european reciprocal licensing agreement (whose
name I don't remember). If I were going to visit several countries, it
might be easier to get a license from one of the member countries than to
get reciprocal licenses from each of them.

Sheesh... I wish that had happened to me. I only tested twice on my 20.
But one thing I've found... if I go in to take a test, I always passed
it. So here I sit, at Extra and wondering what else I can do in the way
of licenses. :)

Well, I can't exactly say about along the Mississippi, but as you have probably heard, Des Moines, Iowa, had a little bit of flooding over the weekend. (Nothing much, just lost tap water and electricity for most of the Metro area and downtown is under water. ;)
Anyway, the Des Moines Radio Amateur Association (DMRAA) has set up stations at several sites across the city--Polk County Sheriff, City Police, various state and county offices, and the Red Cross--and have been relaying a *lot* of emergency traffic. They plan to continue this for at least several more days, working in 6 hour shifts.

>bander for the ham bands, and can afford the extra dollars, the Yaesu
>is the way to go.
>
Your information is in error. The FT530 has expanded coverage including aircraft am and 800-950 (or so) plus the upper 400mhz public service bands by the removal of a solder jumper. I did this mod in 10 minutes with a bit of solder wick. Also, it covers 430-450 tx & rx out of the box, which is good for us international travellers since 430-440 is the fm repeater section of UHF in other countries. Also, you can enable 1750 hz tone burst for European use.

DEBCO Electronics of Cincinnati OH is selling Collins 455Kcs mechanical
filters for $5. The catch: the bw is 30kc. Can the bandwidth of these
be easily reduced?

>> modified to work at full power.

>Perhaps if you'd said that in the beginning, this whole thing might not
>have started.

Said *what* in the beginning?! Talk about revisionism - this "whole thing" started because you claimed that PL decode was "not necessary on any mobile or HT," and then proclaimed that I had been "rooked" because I bought the 5200 instead of the 5100. Gee, I can't seem to pry the control head off my 5100. What am I doing wrong?

> My 5100 WILL do 50W in x-band but they recommend against
>it, same as they do with the 5200.
>
> Tony Pelliccio kd1nr/ae

I have seen nothing recommending against running the 5200 on high power in xband repeat mode. Who is "they," anyway?

OBcontent: I found another need for PL decode on a mobile radio recently. Our club just put its new 443.475 repeater on the air, and a whole slew of us who have been primarily using a 147.225 repeater have begun using the 70cm repeater for most of our communications. However, many of us still use the 2m machine frequently as well. Obviously this freq pair causes problems for a dual-band rig - the solution is going to be a PL tone on the 70cm repeater output and tone squelch on the mobiles and HTs.

|> I was curious what roles the ARES and theNTS were playing in the flood
|> areas along the Mississippi. Also are HAMs active in Mexico with the
|> Hurricane there?

What I have heard is that ARES people are manning the levies and reporting water levels. There may be some other activities as well. At this time, the normal means of communication (telephones, public safety radio, etc) are all functioning normally in most areas.

I've also heard from a friend at FEMA that while they have many people on the scene, there has been no need for their communications folks yet. hurricanes produce much greater communications needs than floods, it would seem.

I have not heard anything about hams in mexico, other than an interesting exchange on the maritime mobile net the other night. CNN and Headline News were reporting Puerta Vallarta was being hit by the hurricaine. A ham in Puerta Vallarta was saying on the net that there was no such problem (heavy rain, yes, damage, no), and was asking someone to call CNN (which they were watching down there) to get CNN to stop freaking out the relatives of vacationers. Some H&W traffic to tell people "all OK" were sent as well...

>If it works well, then that was the goal, right? But that doesn't
>mean what some of us say.

I have a shortened (51 ft) G5RV that really gets out on 20 and 40 meters and but isn't all that great on 10 and 15 meters. When I checked the SWR on 20 it is about 2.7:1 more or less across the band. 40 is a lot worse as is 15 and 10 meters. However it loads up great on 20 and 40 and works great there. It will load up on 15 it doesn't work all that well and 10 is worse then that. My question is why doesn't it work as well on 15 and 10 as 20 and 40 do? As a antenna itself doesn't actually have to be resonant on a frequency is it just radiation efficiency that determines whether a antenna works well or not? I am not really sure why two antennas, both non-resonant, will have one that works much better then the other one. Thanks for any answers here!

From: lawrence@combdyn.com
Message-ID: <1993Jul12.163035.5507@combdyn.com>
Source record: 279343

Can somebody tell me where I might look for the source of interference on
Channel 6? I'm getting reports that the video is being interferred with.

None of the other channels are being affected, but Channel 6 is a fairly
weak signal. And, its a Cable channel.

I'm sure it isn't me that's causing the interference, since the times don't
correspond to when I'm operating (2m/70cm)....

>Any other experiences? Is this common?
>
>Howard hlester@as.arizona.edu
>
>

When I wrote my exams in May, for the first few elements, the room
was quite quiet. But as the day progressed, the noise level became
progressively higher, as well. By the time I got to element 4B, I
could scarcely concentrate for the QRM, and after 5 exams, as well
as the CW exam, I was at the end of my tether! They had a separate
enclosed room for the CW test, which was very quiet, certainly
during the test! :-) Still waiting on my licence.

The European organisation is called CEPT (A French abbreviation). According
to my last licence (renewal due in 2 weeks :-)) the ones that have
ratified the appropriate treaty are:
Austria, Belgium, Switzerland, Germany, Denmark, Spain, France, Finland,
Greece, Hungary, Italy, Ireland, Luxembourg, Monaco, Norway, Netherlands,
Sweden, Liechenstein, Czech Republic, Slovak Republic.

I can't remember precisely, but I believe one or two countries outside
Europe have ratified the treaty as well (VE ??).

What this means, if I want to operate in HB9, I just sign HB9/G1PJJ , no
formalities.

>they aren't synchronized?

Well, what I was trying to cobble together here is that I don't think I've heard this effect on relatively late CPU-controlled Kenwood radios with IF shift. The TS-820, -830, -120, -130, -530 (list not all-inclusive) have electronic IF shift and synthesizers, but no CPU. *They* are the radios in which I've heard this IF-shift pitch wiggle. It would be "just code" to mask the effect in radios using CPUs to do most of the freq-control housekeeping, whatever the control input means.

Yes, this is a possible point of departure for a thread on how various CPU-controlled radios do their IF shift--A/Ding pots voltage for control versus shaft "encosion" [well, hey, if *eroding* something causes *erosion*, doesn't *encoding* something cause *encosion*? :-O], etc--but I'm bailing out.

Some years ago I worked with rf plasmas in a large metal (read: shielded) vacuum chamber. I used an industrial rf source (tubes) that put out about 400 watts. I got best resuts around 27 MHz (honest, it really did work best there). As pointed out, the impeadance changes from very high to quite low as soon as the plasma starts and it was necessary to adjust the matching network while trying to start the plasma. I used both a Johnson KW Matchbox and a Murch 2000B which was a ARRL handbook design. The Johnson worked best. The roller inductor in the Murch overheated and sagged. The capacitors in the Johnson got quite warm and became hard to adjust during long operating times but they survived and were easy to turn once they cooled down. I had to use coax feedlines that could stand a lot of heat. I found some fiberglass wrapped teflon dielectric coax used for broadcast service (RG 225???)
Have fun

Jeff:

Probably because "all other things aren't being equal". I wonder if the power into the antenna (antenna = radiating thing) is the same in each case. Also height above ground can affect performance. This height (referenced to a wavelength) varies with frequency.

Also the radiation pattern is very different as the length (again in electrical degrees) of the antenna (antenna = radiating thing) changes, when the frequency changes.

In short, as you change frequency, it's not the same antenna.

4743. CDE antenna rotor

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 19:46:11 UTC
From: nat@kpc.com
Message-ID: <1993Jul12.194611.21548@kpc.com>
Source record: 279412

Hi,
I picked up an antenna rotor at the Foothill College Fleamarket. The
following information came off the rotor controller box.

Model AR-33 115V AC 60Cyc 1.0 Amp.
Made by
Cornell Dubilier Electronic Division
Fedral Pacific Electric Co.
Fuquay-Varina, North Carolina.

Pat NO 3,043,998.
Series 1 - 820.
The rotor takes a 5 wire control cable.

Anybody know anything about this beast.
1. How much torque does it generate?
2. What wind load can it support?
3. How do I align it to North? (At the bottom of the controller there
are 2 adjustments. a) Extent of rotation b) Sensitivity.)
4. How old is this? Not that is matters. I paid $25 and it rotates.

I and going to take it apart to clean and regrease the bearings. So a
service mannual may be of help. What type of grease should I use? I live in San
Jose and it is sunny most of the time.

Thanks in advance.
Nat.

4744. Communities that unduly restrict Amateur Radio operations

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 20:06:32 UTC
From: Bruce@Pixar.com
Message-ID: <1993Jul12.200632.23803@pixar.com>
Source record: 279425

There's been a lot of discussion of late regarding local antenna restrictions and ham-unfriendly communities.

I'd like to know if anyone at ARRL or elsewhere is keeping an anecdotal file on communities that attempt to restrict amateur radio activities, through antenna restrictions, nusiance suits, and otherwise. If so, is this file publicly accessable?

For instance, I'd never consider a home in a community with antenna restrictions. However, I'd like to know if there's been any other anti-ham activity in that community before I purchase a home there.

If such a list were online for FTP access, it would be easy enough to organize it as a hierarchical directory tree, with 50 directories for U.S. states, each containing directories for counties, which would contain files for each community where there had been anti-ham activity. It would be easy enough to make this accessable via a mail server for the amateur packet network, as well.

I have a really good relationship with my neighbors. I've made sure that everyone had a number to call in case of interference and was aware of the benefits of having a ham in the neighborhood during the earthquakes and fires that happen in our area. I'd do the same in any area I moved into, but I'm not interested in moving into an area that's already anti-ham. I think it's a good idea for hams to use their economic power by avoiding a home purchase in such communities. Perhaps we should even avoid patronizing businesses in those areas. Maybe that would help them get the message.

> 0
> instead of the 5100. Gee, I can't seem to pry the control head off my 5100.
> What am I doing wrong?

First off, you stated that the radio only put out 5W leading most people
to assume that it was only capable of 5W in normal transmit mode. As far
as prying the head off the 5100, those of us who bought one didn't want
to. The damned radio is small enough that you can just take it with you,
not to mention the nice mounting bracket they give you that just clips
on and off. And yes, for that removable control head I think the price
is just a little too high. :)

>> My 5100 WILL do 50W in x-band but they recommend against

> I have seen nothing recommending against running the 5200 on high power in
> xband repeat mode. Who is "they," anyway?

"They" is Yaesu. At least thats what it says in the newer books I've
seen for the 5100 and the 5200.

4746. Advanced Computer Controls Mailing List

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 20:20:36 UTC
From: ccoprfm@prism.gatech.EDU
Message-ID: <104618@hydra.gatech.EDU>
Source record: 279413

Hello,

I am the list owner of a mailing list for people who have/are interested in Products produced by Advanced Computer Controls Inc. (ACC). For those who might not know what ACC does; they produce products (mostly for the amateur radio service) such as repeater controlers, digital voice recorders, remote base control units, etc.

If you have one of their products, or use a repeater that has one of them, then you might be interested in joining the list. To do so, simply send a mail message to listserv@gitvm1.gatech.edu. In the body of the message, simply say "subscribe acc-l <your name>". That's all there is to it.

If you think you would like to be a part of this list, but are worried about getting on a high-traffic list; don't (worry that is). We get somewhere between 10-15 messages a month on average. That doesn't mean that there is nothing to gain from the list though. Remember, a mailing list is only as good as the people who take part in it....

Hope to see you on the list,

Monte Freeman - KC4GPW List Owner

4747. What does it take to fry RG-223

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-12 20:30:52 UTC
From: nat@kpc.com
Message-ID: <1993Jul12.203052.28923@kpc.com>
Source record: 279414

Hi,
My station is a Kenwood TS520S, rated to produce a Max of 150 watts. I have a new antenna to hook up. MECI of Ohio sells RG-223 for 10c/foot. The question that I had was, "Will 150 watts fry the cable".

RG-223 specs is as follows:
50 ohm 66% Velocity Factor 30.8 pf/foot OD 0.212".
Polyethylene Dielectric, Double Shielding, Max RMSV 1900 Volts.

Here is how I went about answering the question.

Power = VRMS*VRMS/R

VRMS = sqrt(POWER * R)
= sqrt(150 * 50)
= 86.6 Volts.

Assuming horrible antenna match the Max SWR should be (1900/87) = 21.
I think the cable will survive.

Could the Gary Coffman types find a hole in my thinking or show me the correct way to look at this problem.

Thanks in advace
Nat.

First of all, congratulations and welcome to ham radio!!!

As for the CW in the same room, that is the way I've always seen the test session handled. One thing that they mentioned to me when I took the test for Novice and Tech was that I could actually take the written test while the CW was not being sent. This might take a little longer, but it may help if you are having trouble concentrating.

>> Jonathan Alexander Walkenstein A.K.A. guest@phoenix1.ir.miami.edu

One of the best buys I have ever made was at a surplus auction where I got two complete plasma rf generator systems made by Plasma-Therm (or something like that) in New Jersey. Phone 609/767-6120 (according to Thonas Register).

One sub-unit was a 500w 13.xx MHz Rf generator (oscillator driving a 6146 driving a 4-400). This has a Pi-net output with fixed loading caps. The other sub-unit is the really nifty part and why you should try to find if this company is still around. It is an automatic matching L network - shunt motor-driven vacuum variable on the input with a coil (big, silver plated) and another motor-driven vacuum variable in series with the load. A directional coupler feeds a control system to drive the two vacuum variables to minimize VSWR. I have no idea what the response time to changing loads was supposed to be.

I would think these people make the right kind of equipment for your application much more than any appplicable ham gear. I imagine they are expensive when new. I was very pleased to get two systems (power supplies and all) at a surplus auction for $25 :-) A friend and I plan to have fun making these into useful ham gear :-)

I might have taken that charitable view of the posting had the
poster not said "One must presume that this is computer to computer
communications". Unless the brain is included as the computer (in
which case I also hear machine-generated SSB conversations going
on, so presume computers are being used and therefore SSB is obsolete,
etc...), I think his meaning was "wow, this stuff is too fast for me,
they must be using one o' them darned computer thangs".

CW sending is still an art, and none the worse for that.

Jeff-

One factor to consider, is that a dipole such as this, will radiate more toward the end at higher frequencies, and more broadside on lower frequencies. Maybe there aren't any stations in the direction it favors on 10 and 15.

I'm currently looking for a nice 2m HT to do some SKYWARN spotting with, and my eye has hit upon the Alinco DJ-180T. It's cheap and seems to be a better bargain than the HTX-202 (at least when RS doesn't have the 202 on sale). More importantly, it can RX the NOAA Weather frequencies. Anyone have anything to say about it, pro or con? (Email is preferred; I'll summarize if there's interest).

Thanks in advance...

Well, I have one (in fact I had two - one was a gift. :-) and it works
wonderfully for a single-band HT. It has a very tight front end -
no intermod here at all. True FM, and the battery lasts forever.

But as a previous poster said, don't bother asking about mods. The
only one I've seen was bogus.

This comming Sunday

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
July 18th, 1993
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

QST DE W1AW
DX BULLETIN 35 ARLD035
FROM ARRL HEADQUARTERS
NEWINGTON CT JULY 8, 1993
TO ALL RADIO AMATEURS

SB DX ARL ARLD035
ARLD035 DX NEWS

THANKS TO ROLF, SM5MX BOB, W5KNE QRZ DX CHOD, VP2ML THE DX BULLETIN THE ARRL QSL BUREAU AND THE DXCC DESK FOR THE ITEMS IN THIS WEEK'S BULLETIN.

SAUDI ARABIA. ALAN, KD4MAE, EXPECTS TO BE STATIONED AT THE US EMBASSY IN MID-JULY AND SIGN 7Z1AB. KN4F IS TO ASSUME QSL DUTIES SOON.

YEMEN. IF PLANS COME TOGETHER, 4W1UA OPERATED BY AN INTERNATIONAL TEAM OF OPERATORS WILL TAKE TO THE AIR OCTOBER 15 THROUGH 29. OTTO, UA4WAE, AND PAUL, KK6H, ARE SPEARHEADING THIS EFFORT.

MARSHALL ISLANDS. KEN, V73C, CAN BE WORKED JUST BELOW 14200 KHZ AROUND 1115Z. A 13 TO 30 MHZ LOG PERIODIC ARRAY, LPA, AT 55 FEET ACCOUNTS FOR HIS BOOMING SIGNAL. MOBILE STATIONS IN NEW ENGLAND HAVE GOTTEN THROUGH ON THE FIRST CALL.

ROTUMA ISLAND RON, ZL1AMO, IS NOW SIGNING 3D2RW/R. HE USUALLY LISTENS DOWN FROM HIS OPERATING FREQUENCY. QSL HIS HOME CALL, DIRECT ONLY.

ERITREA. ERIC, NM5M, PLANS TO START OPERATIONS IN MID-JULY AS E35M. THIS WILL NOT BE A FULL BLOWN DXPEDITION DUE TO THE TRIP BEING BUSINESS IN NATURE. HOWEVER, ERIC EXPECTS TO BE AS ACTIVE AS POSSIBLE DURING HIS OFF HOURS, CONCENTRATING ON CW. QSL VIA HOME CALL.

CHINA. HERE'S A MOUTHFUL. BT2000BJ, YES, BT2000BJ, IS ACTIVE THROUGH THE END OF JULY ON ALL BANDS FROM 40 THROUGH 10 METERS, INCLUDING WARC. OPERATIONS ARE USUALLY BETWEEN 1200 AND 2200Z. 16 OPERATORS ARE ON TAP FOR SSB 3 FOR RTTY AND AMTOR AND 2 FOR CW. QSL VIA BY1QH, PO BOX 2654, BEIJING 100084, PEOPLE'S REPUBLIC OF CHINA.

LIECHTENSTEIN. F1ODK, FD1RZJ, FD1NZO AND OTHERS PLAN THEIR DXPEDITION FOR JULY 17 THROUGH 24. CHECK 3795, 7045, 14200, 21290,

28490 AND OSCAR 13. QSL VIA FD1RZJ.

DXCC DESK. THE DXCC BACKLOG HAS BECOME HISTORY, AS HAS THE NIGHT SHIFT. THIS WEEK, STAFF HAD TO OPEN MAIL TO HAVE CARDS TO WORK ON. THERE ARE LESS THAN ONE HUNDRED APPLICATIONS THAT HAVE NOT YET BEEN RETURNED.

QSLING STILL A POPULAR AVOCATION. NEARLY 48,000 CARDS WERE RECEIVED FROM BOX 88 IN A RECENT 1-1/2 WEEK PERIOD. THE ARRL QSL BUREAU REPORTS THAT ALL BOX 88 CARDS HAVE BEEN SORTED AND FORWARDED TO U.S. INCOMING QSL BUREAUS. SO FAR IN 1993, THE ARRL QSL BUREAU HAS MAILED 1,183,060 QSLS.

WA6AUE RECENTLY SHIPPED 52 POUNDS OF V51Z, AX9Z/1 AND CT3BH QSLS. ALL HAVE BEEN SORTED AND MAILED TO U.S. INCOMING QSL BUREAUS.

THIS WEEKEND ON THE RADIO.

IARU HF CHAMPIONSHIP. LOOK FOR ZF2JI FROM THE CAYMAN ISLANDS ON ALL BANDS OPERATED BY JOHN, K4IIF. QSL VIA KG6AR. OPERATORS OH1VR, OH6LI AND AH6MM WILL BE ON MARKET REEF RUNNING OJ0/OH1VR DURING THE TEST. QSL VIA OH1VR. OJ0/AH6MM WILL BE ACTIVE DURING NON-CONTEST PERIODS. APRIL QST PAGE 105.

THE QRP AMATEUR RADIO CLUB INTERNATIONAL SPONSORS THE SUMMER HOMEBREW SPRINT. FOR DETAILS CHECK PAGE 117 OF JUNE QST.

CQ VHF WPX CONTEST, A 27 HOUR EVENT, KICKS OFF AT 1800Z ON JULY 10. FOR FURTHER INFORMATION SEE PAGE 117 OF JUNE QST.

4760. HT stories wanted

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 01:39:09 UTC
From: pachner@csd4.csd.uwm.edu
Message-ID: <21t3ntINNgbk@uwm.edu>
Source record: 279329

Just curious to know what sort of HT stories there are:

1. humerous
2. disasterous
3. or just plain interesting

I will compile them to a master file for reference.

If you'd like a copy send me your email address.

4762. Wideband Modification for Icom IC W21AT Dual Band HT

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 02:06:49 UTC
From: stoll@ocf.berkeley.edu
Message-ID: <21t5bp$4r9@agate.berkeley.edu>
Source record: 279331

The Icom IC W21AT handi-talkie normally receives two bands:
136 to 174 MHz and 440 to 450 MHz.

You can program it to receive
50 to 300 MHz and 300 to 999 MHz.

To do this, turn it off, then simultaneously hold down
the # and the B keys while turning it on. Keep them pressed
for 2 seconds after turning the rig on.

The LCD display will go through a self test, and you'll
then have a wideband receiver. It's not very sensitive
far from the ham bands, but it's handy for listening to
6 Meters or as a portable scanner.

Note that this modification does not require any cutting of
diodes or rewiring -- it's entirely front panel.

Looking at the schematic, there is a way to
cut two diodes to permit transmitting outside the Ham bands (eg MARS).
However, I cannot find the diodes on the PC board (it's crowded in there!).

Cheers es 73's,
Cliff Stoll K7TA

4763. Re: Yaesu FT-530 or Alinco DJ-580T?

Newsgroup: rec.radio.amateur.misc

>burst for European use.

How do you enable tone burst? I called Yaesu a few months ago and they had
no idea, and I haven't seen a mod to do that elsewhere, only the extended
transmit and receive mods (which were, as you say, easy, but you need a
soldering iron with a tiny tip).

>like a painting of a polar bear in a snow storm. Hams who use iambic
>paddles and such might as well be using a computer. I can't tell the
>difference.

I tried to reply to this personally, but the mail bounced...

All I meant really was that e.g. some people still manage to screw up their sending with extra dits all over the place. Art is perhaps a bit extreme, although I have heard some paddle-generated 45 wpm stuff that is music to my ears.

I used to think it was nice that people had recognizable "fists" but now I prefer the properly-spaced stuff. This is perhaps inconsistent, as I prefer early music, where improvisation and ornamentation are expected, over the modern stuff that is written out note by note with no departures permitted (by modern, I mean Brahms and such stuff).

I have been meaning to ask a local if I can borrow his Vibroplex, so I'm not entirely against a bit of departure from perfect CW, and anything beats listening to the phone bands for very long...

A multi-transmitter system could be a good thing for repeater networks
to migrate towards. They could cover a little more area and
use less frequencies.

4766. CW from 10wpm to 30wpm (a review)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 03:27:47 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <CA32yB.IIy@odin.corp.sgi.com>
Source record: 279336

Gang,

are you one who has gotten their speed from 0 wpm to 10 or so wpm?
reached a plateau and feel like you just can't get any further?

i purchased a set of tapes at the Dallas/Ft Worth/Arlington swapfest
called Hamcom. i didn't need the tapes, i was interested in seeing
how someone else taught the code. i took the three tapes with me
on a two week trip to MD (3 land) with my Sony WM-10 player. along
with some higher speed tapes that i generated for myself. i did HAVE
to buy something at Hamcom, since the only thing that i had bought
after two days was a tube for a VE7. (the tube's in the mail Laura). ;-)

the tapes run $19.95 and if you order them, i'm sure there is
shipping and handling. i don't know, but if i find out i'll post. guess $5.
maybe someone else already knows. the tapes are called "10-30 WPM WORDS"
from Jerry Ziliak's AMATEUR RADIO SCHOOL, 2350 Rosalia Drive, Fullerton,
CA 92635. they are 90 minute tapes. starting at 10 wpm, Jerry (with
voice instructions) leads you through recognizing characters and then words
at higher speeds. i highly recommend the tapes for the individual at
10 wpm or so. maybe even the 20 wpm critters too.

if you commute and wanna start getting the code speed up for the
upgrade, this is the way to do it. think about how much time you spend
on the freeways to/from work each day. if you're not already hamming
during this period or want to change, this is something to consider.

after you finish these tapes, photocopy the side A label of the third
tape and send it to me. send me a note that you've listened to the tapes
and have them memorized or learned. i'll take your word for it and
i'll send you something. maybe even set up a sked.

i'm not associated with the above establishment in any way. i do not
get any commission or other monitary rewards for this. i'm just a CW
nut out to convert a few. :-) ;-) for the humour empaired.

ok, for those not at this level. start with the ARRL tapes for learning
the code. then get the 12 to 22 wpm tapes from ARRL, then the above.
remember if it was easy, everybody would be doing it. come on down
where the people are friendly 99.9% of the time and it's not too crowded.
:-) did hear someone two nights ago at 7.030 or so get on top of someone
calling CQ at 35 wpm. this guy sent LID after the CQer stood by. don't
know what was going on, but the guy sending LID left after being ignored
three times.

73 es gl. bcnu agn on cw es t u de k5fo dit dit

p.s. any OFs remember a set of reel to reel tapes that went to 80 wpm?
i have friend who has them, but he hasn't had them out in 20 years.
can't get him off his duff to send them to me. probably won't play
anymore. these tapes were created about the 1970 timeframe.

4769. Short range I/R comms - any pointers?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 06:50:10 UTC
From: dtock@nyx.cs.du.edu
Message-ID: <1993Jul13.065010.10162@mnemosyne.cs.du.edu>
Source record: 279342

I would like to install a 2way voice link between my car and my wifes car (no, she _won't_ get a licence) for those many occasions we end up taking two cars and follow each other down the road.

An infra red line of sight system would appear suitable. Does anyone have any pointers or references to such a thing. I am sure I have read about it here before, as an example of pushing the RF frequency to the limit.

Any help appreciated.

David, GM0SYA

4770. FEEDBACK is driving me MAD!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 07:42:56 UTC
From: thompsa1597@iscsvax.uni.edu
Message-ID: <1993Jul13.014256.14702@iscsvax.uni.edu>
Source record: 279341

I'm having some problems with my RCI 2950. Feedback is driving me nutz.
It is being caused by a 100w "generic" rectangular linear. (I've seen
many of thje same design; I got this one used, with no literature) When
I key down on LSB/USB and modulate, the feedback starts. I can even unplug
the 2950 and the feedback is still going. It will stop if I unscrew the
coax from radio to linear, or if I shut the amp off.

Any ideas what could be the cause of the problems? (I suspect the linear
is trashy, and needs to be modified/thrown away; it is currently in
good repair)

(my SWR is 1.3:1 (radio to amp) and the power wires are well
filtered, and the antennae is well grounded)

Any help is greatly appreciated.

4771. Announcement - ARRL Automated Electronic Mail Server (info@arrl.org)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 07:47:42 UTC
From: ehare@arrl.org
Message-ID: <rec-radio-info742612311@ve6mgs.ampr.ab.ca>
Source record: 279252
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The American Radio Relay League (ARRL) has a useful service -- the ARRL
Automated Electronic Mail Server. This server lets you access many of our
information files, containing information about various facets of
Amateur Radio. You can retrieve any or all of these files by sending
an email message containing valid commands to info@arrl.org here
at ARRL HQ. Each file you request is then mailed to you automatically,
usually within a few hours.

To use it, mail messages to:

info@arrl.org

The subject line is ignored. Each line of the message should contain a
command as shown below. You may place as many commands in a message as
you want. Each file you request will be sent to you in a separate message.
Only ASCII text files are supported at present.

Valid INFO commands:

help Sends this help file
index Sends an index of the files available from INFO
send FILENAME Sends "FILENAME" example: send ARRL-EMAIL-ADR
quit Terminates the transaction (use this if you have
a signature or other text at the end of the message.)
reply <address> Sends the response to the specified address. Put this
at the BEGINNING of your message if your From: address
is not a valid Internet address.

Note: your message will *not* be read by a human! Do not include any
requests or questions except by way of the above commands. Retrieve
the "ARRL-EMAIL-ADR" file for a list of addresses of ARRL HQ staff.

Sample of files available from INFO: (There are lots more!)

From: clifto@indep1.UUCP
Message-ID: <2347@indep1.UUCP>
Source record: 279345

In article <1993Jul12.200632.23803@pixar.com> Bruce@Pixar.com (Bruce Perens) writes:
>but I'm not interested in moving into an area that's already anti-ham.
>I think it's a good idea for hams to use their economic power by avoiding
>a home purchase in such communities. Perhaps we should even avoid patronizing
>businesses in those areas. Maybe that would help them get the message.

It may be petty of me, but as far as I'm concerned, just wait until one
of those communities needs disaster relief communications. I suppose I could
even say I have a valid reason for that; with this recent court decision
holding that ham radio is a nuisance, I could even get sued for using my
radio in such an area, being that Illinois doesn't have a "good samaritan"
law (which usually applies to first aid and/or medical treatment anyway).
If they don't want me around when I'm getting the practice I need, when
I'm hooking up to the nets I'll need for emergencies and getting to know
the people I'll be working with, then as far as I'm concerned they don't
want me around when the tornado hits, either.

> Curious Jamie ANDERJH@DUCVAX.AUBURN.EDU

The signals are true digital signals. The modulation format is QPSK with
5 carriers multiplexed into the 6 MHz TV channel. They are NOT FM. It is
refered to as having "quality" comparable to FM stereo. Scientific
Atlanta is the manufacturer of the system. It is based on their SEDAT
digital audio compression system which is used by the CBS and ABC radio
networks.

What are the 2m FM mobile radios you like and why?

I am looking to buy a new/used radio for the car and am open
to people's experiences with various brands, etc. What do you
think is the best deal for the money?

If you have any suggestions, I would greatly appreciate it.

ARLB071 contest weekend

Your Headquarters station, W1AW, will be active in the IARU contest
this weekend, from 1200z Saturday July 17 to 1200z Sunday the 18th.
Regularly scheduled bulletins and code practices will be suspended
for this operation. The contest exchange is RST, and your ITU zone.
We hope to work you.

902 mhz study sought

''Adopt no rules without further study,'' the ARRL has recommended to the FCC, in a Commission proposal to expand the use of Automatic Vehicle Monitoring (AVM) systems in the 902-928 MHz band.

The proposal, in PR Docket 93-61, would allow the expansion of AVM systems through the creation of a new location and monitoring service (LMS) in the 902-928 MHz band. Amateurs already share this band with government radiolocation, fixed, and mobile services, in addition to industrial, scientific, and medical (ISM) equipment and various non-licensed, low-power ''Part 15'' devices.

The FCC said in its Notice of Proposed Rule Making that such an expansion of AVM in this frequency range ''could lead to rapid congestion of available spectrum'' and asked current users of the band if they could handle any increased congestion.

''If not,'' the FCC said, ''commenters should offer potential solutions, short of removing Part 15 users and amateur operations from the band, restricting where such users could operate in the band, or placing stricter limitations on the operations in this band.''

The League said that no action should be taken until the FCC has studied the potential for interaction between AVM and wind profiler radar systems, the suitabliity of AVM operations for highway safety sytems in a crowded RF environment, and the alternative technologies available for the same purpose served by AVM and Location and Monitoring Services.

From ARRL Headquarters
Newington CT July 9, 1993
To all radio amateurs

SB QST ARL ARLB073
ARLB073 449 mHz plan opposed

449 MHz plan opposed

The League has told the FCC that a proposal to allocate the frequency 449 MHz for wind profiler radar systems should be based only on careful coordination processes and site selection, to avoid interference to amateurs, who share on a secondary basis the band 420-450 MHz with government (military) radiolocation operations.

In April the FCC issued an Notice of Proposed Rule Making (in ET Docket 93-59) to make the allocation, and asked for comments on whether wind profilers should also be accommodated in the 915 MHz band or elsewhere.

The League told the FCC that the 420-450 MHz band is heavily used by the Amateur Radio Service, especially for FM repeaters, it being the second most popular VHF/UHF amateur allocation, with more than 5,000 repeaters.

These repeaters are used for public service communications, especially in metropolitan areas, and are important in the connection between Amateur Radio and the government's SKYWARN severe weather warning system, the League said.

The League said that it appears possible that government wind profilers could be used in this band without disrupting existing amateur operations, but only with proper coordination, and that non-government profilers could present even more serious interference possibilities. More information is in QST for May 1993, page 88.

From ARRL Headquarters
Newington CT July 9, 1993
To all radio amateurs

SB QST ARL ARLB074
ARLB074 Message content proposal

Message content proposal

The ARRL had filed comments with the FCC on their proposal to define the responsibility for the content of amateur messages relayed by high-speed networks.

The FCC's proposal, in PR Docket 93-85, was in response to a number of petitions for rule making, and would establish ''a compliance policy for amateur stations participating in automatic message forwarding systems, to hold the licensee of the station originating a message and the licensee of the first forwarding station primarily accountable for violative communications.''

The petitions were filed following an incident in early 1991, when the operators of several amateur packet bulletin boards were cited by the Commission for forwarding what was characterized as a ''commercial'' message.

The proposal would modify current FCC rules, which provide accountability of each licensee for every transmission from the licensee's station, regardless of the configuration of the system of stations in a data network or whether the station is in repeater operation.

The League suggested that some fine tuning of the definitions of the terms ''originator'' and ''first forwarder'' was needed.

Just to cloud the issue, I saw an infomercial this weekend with Dick Clark touting a recharger for STANDARD ALKALINES (they were using Duracells in the ad, judging from the packaging, although the camera never got quite close enough to tell...). They made a big deal about it using standard alkalines and recharging to give up to a total of 500 hours service in xstr radios, tape players, etc.

Q1: Anyone else catch this?
Q2: How in the world do they keep them from exploding--charge reeeeeaaaal slow?
Q3: What about the MnO2 deplenishment a recent poster noted occurs, as a part of normal discharging, which recharging doesn't reverse?

Q4: Why ask why? (sorry--listening to too many beer commercials!)

>antenna restrictions, nusiance suits, and otherwise. If so, is this file
>publicly accessable?

This is a good suggestion, however, it isn't possible for several
reasons. I work in the Regulatory Information Branch at ARRL HQ
and one of the things we do is assist amateurs who are faced with
overly restrictive local zoning ordinances. Our branch (which
consists of three people) receives around 10 to 15 calls a day
from people who are faced with overly restrictive ordinances.

It's a physical impossibility for ARRL HQ to stay up-to-date on the
various antenna ordinances of all towns and cities in the US. First,
there are no attorneys at ARRL HQ. ARRL General Counsel Chris Imlay, N3AKD,
one of Washington, DC's best communications lawyers, does the heavy duty legal
work for ARRL. ARRL is but one of his clients. Second, ARRL has
an excellent network of thousands of volunteers throughout the US. ARRL Local
Government Liaisons are experts in the workings of local governments.
Your ARRL Section Manager can give you his or her name. ARRL Volunteer
Counsel members are hams who are also lawyers. ARRL Volunteer Cousulting
Engineers may also be able to assist. If you need a VC and/or VCE in your
area, contact the Regulatory Information Branch at HQ. Third, if
ARRL HQ maintained such a list and a particular ordinance changed,
we could be giving out potentially wrong information if we're not
notified of the change.

The best course of action for anyone faced with town zoning ordinance problems
is to contact your local Zoning and Planning Department and ask
what the limit is for Amateur Radio antennas. Make sure you
specify Amateur Radio because PRB-1. the Federal declaratory ruling,
applies to Amateur Radio antennas only. PRB-1 states that local
municipalities must reasonably accommodate amateur antennas and
their zoning rules must constitute the minimum practicable regulation
to accomplish the local authorities legitimate purpose.
Covenants and deed restrictions are excluded from the PRB-1 ruling.

One of the many membership services ARRL HQ offers is the "PRB-1
package." HQ is only able to send out this large 150 page package to
amateurs who have specific zoning problems since it is so expensive to
print and mail. Whenever requesting the package, always give a

brief description of your zoning problem. The Regulatory Information Branch may have other or additional information to help in a specific situation. Also, the text of PRB-1 is included in any FCC Rule Book which is published by ARRL. Chapter 3 is dedicated to zoning regulations. PRB-1 is codified in Part 97 under Section 97.15(e). If, after showing your City Attorney PRB-1, you still have a problem, contact the Regulatory Information Branch at HQ and we can send you a number of cases and sample ordinances.

>
> Could the Gary Coffman types find a hole in my thinking or show me
>the correct way to look at this problem.

Well you're close, but no cigar. Here's the formula for Emax on a line
with SWR.

Emax=sqrt(P*Zo*SWR)

For a SWR of unity, that gives 86.6 volts just like you figured. But
for a SWR of 21, the maximum voltage is 396.86. Rearranging terms
we find that we need a SWR of 481.33:1 to reach 1900 volts Emax.
Emin is easier. It's just Emax/SWR. Or, in this extreme case,
1900/481.33=3.947 volts. The reason we're interested in Emin is
that we can determine how much current the cable will be carrying
at the voltage minimum by P/Emin, or 150/3.947=38 amperes. Now
this is cause for concern. That's a heavy current load for this
small cable. Of course the SWR is extreme. Let's look at a more
typical worst case SWR of 10:1. This is a value that may be
experienced in practice with a random flattop antenna.

Emax=sqrt(150*50*10)=273.86
Emin=273.86/10=27.39
Imax=150/27.39=5.48 amperes

Now cables have somewhat different characteristics at RF than they
do at DC. Dielectric losses are proportional to Emax, and skin effect
conduction losses are proportional to Imax. So a cable with SWR will
have two different regions of "hot spots". At Emax the dielectric
will be hot, and at Imax the conductors will be hot. We can't just
go to the copper wire tables for conduction losses because RF losses
are skin effects and the RF skin depth is frequency dependent. Dielectric
losses are also frequency dependent. Our best guide is the db loss
per 100 foot value that the manufacturer usually gives us. We can then
use the curves for excess loss due to SWR in the handbook to give us
an idea of the amount of power the cable will have to absorb. That
power can then be apportioned based on Emax/Emin to show what the
hot spots will be like. In your case, the cable will handle the power.

>good repair)

You have identified the problem. Your amp is not unconditionally
stable. In fact it's not stable at all. Once you start it into
oscillation, the reactance of the radio's output stage is sufficient
to keep it oscillating. A quick and dirty fix is to use swamping
resistors in the amplifier input. But the amp is likely spectrally
nasty in any event. These "CB" footwarmers usually are.

I purchased a used Uniden HR2600 at the Indianapolis Hamfest last
weekend. The person I bought it from said that he had no problems
with it, but then again, it was a hamfest warranty :-)

When I tried it out in the car on the way home, I noticed the heat sink
was HOT, even though I only transmitted once on 29.600 FM, into a magnet
mount CB antenna.

When I got home, I put it on my watt meter/load and checked it out.

I noted the following results:

RF Out DC Current Function

0 .4A FM Recv
8W 3.25A FM Xmit
0 3.13A FM Recv (un-key the mic from above)
0 2.73A Turn radio power switch off
0 0 Turn off Power Supply
0 0 Turn on Power Supply
0 .4A Turn on Radio

The above are repeatable, and similar in AM and SSB modes. Keying the
mic with no modulation on SSB draws .65A, jumps to 3.13A when you unkey
the mic. The heat is comming from the driver and/or final output transistor
attached to the heat sink. The radio does not appear to have been worked on.
10 was dead at the time, so I don't know if the receiver was working or not,
but you do hear the appropriate noise that one would expect.

Has anyone seen this before ? Does anyone have a copy of the service
manual that I could look at ?

Please resopne via email, since I don't get to read this group very often.

Thanks in advance !

SB DX ARL ARLD036
ARLD036 DXAC Vote Results

The DXAC voted 6 yes and 10 no on the question of adding band or mode-specific Honor Rolls to the DXCC program. Those voting against the proposal were concerned about a proliferation of awards.

In another matter, the DXAC voted unanimously against a proposal that would have changed the Countries List Criteria Point 2, Separation by Water. Under the failed proposal, distances would have changed from 225 2(a) and 500-mile 2(b) separations to 100 miles 2(a) and 100 miles 2(b). Committee members felt there was insufficient support for the proposed change.

RYRYRY - GB2ATG - RYRYRYRYRY - BARTG - RYRYRYRYRY - GB2ATG - RYRYRY

This is the - British Amateur Radio Teledata Group - news broadcast
service for all amateurs and short wave listeners interested in RTTY
and AMTOR.

This news is broadcast during the first full week commencing Monday
each month, to the following schedule..

Evening transmissions at 1930 GMT. on 3.584 MHz. mark.
RTTY on Monday-afsk, Wednesday-afsk, Friday-fsk, and Saturday-afsk.
AMTOR/FEC on Tuesday and Thursday.

Morning transmission at 1000 GMT. on 7.041 MHz. mark.
RTTY on Sunday-afsk.

Stated frequencies could be plus or minus for QRM.

News for July 1993. Bulletin no. 007. (all times are GMT).

BARTG Information.

An additional volunteer member is required as a news transmit station
located in Scotland or northern England and able to transmit RTTY or
AMTOR FEC on 3.5 MHz at 1930 GMT. one weekday or Saturday evening
during the first full week each month. Bulletins are supplied in
several formats i.e. disk or tape.
Offers to GB2ATG editor please.

DX. Activity RTTY.
---
14 MHz.
OH0/SM0AJV 0900, Z32GX 1100, FP/NM7N 1430, 4S7EA 1600, BT2000BJ,

FP/NM7N via VE7YL or N4DDK.
BT2000BJ via BY1QH.

CU2GP via CU2YA.
T91ENS (4N4ENS) via DJ0JV.
5Z4FM to Box 34168, Nairobi.
5X1C to Box 9276, Kampala.
UG6GG via 4X6XK. POB 10589, 17000 Nazareth, Israel.
S92ZM to Glen Britt, CP522 Sao Tome, DRSTP via PORTUGAL.

There is a new qsl bureau address for the Russian Republic
(UA) prefix... P.O.BOX 59, 105122 MOSCOW.

Notes of Interest.

Z3A-Z3Z is the new prefix series for Macedonia (YU5 4N5).

4N4ENS is now using the new call T91ENS.

Wake Island. (KH9). This rare island will be activated by the
California Polytechnic State University ARC. Organised and funded
by the students. Expect all band all mode operations to commence
August 31 to September 10.

St.Pierre and Miquelon (FP) will again be activated by a large group
from July 9 to 13 all bands and modes using own calls/FP. Look for
K8AQM, N8CC, KA8POW, KB8OPT, KD0PF, KB8ECG and N8TIB. QSL all
contacts via NU8Z.

Tromelin (FR/T) is expected to be activated by Jackie FR5ZU sometime
in September or October. He is currently QRV from Glorioso (FR/G).
Guinea Bissau (J5).

Mark J5AUI has been active on RTTY but is now QRT until he is able to
take loan of another computer during the remainder of his time there
which ends in July 1995. For the next 5 weeks he will be active from
Senegal (6W) and then return to (J5).

Belau (KC6) West Caroline Island is the planned destination for a
multi-op dxpedition by the Kyoto radio club of Japan between August
8 and 13 with RTTY included. QSL via JA3ION.

St.Paul Isl. (CY9) it is reported that CY9CWI will be active from
August 14 to 18 with 7-8 ops running all modes.

DXCC backlog at the end of May was reported to be down to
278 applications. (48,803 cards). Turnaround time is currently 6
weeks or less. A year ago it was 6 months. Seems like a good time to
submit or update your claim.

Contests.

The SARTG HF RTTY contest starts Saturday August 14. First period
0000 till 0800. Second period 1600 till 2400. Third period Sunday 15
0800 till 1600. On 10 - 15 - 20 - 40 - 80 metre bands.

Classifications..
a) single operator, all band.
b) single operator, single band.
c) multi operator, single tx, all band.
d) short wave listener, all band.
NOTE..an all band single operator may also enter a single band class of own choice.

Exchange message is..
RST plus serial number commencing 001

Logs must be received by October 16. Addressed to...
SARTG Contest Manager. Bo Ohlsson SM4CMG, Skulsta 1258,
S-710 41 Fellingsbro, Sweden.

Thanks this month to..
G3ZYP. opdx and dxns.

BARTG caters for all data interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers it's own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk
Items for inclusion in the broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

>Post Office Box Box 281107 San Francisco, California 94128 USA

Enable tone burst by jumping pad 13. Then you push the button called
Monitor(Burst) described on page 6 of the manual (RTFM).

Yes, use a small tip low power soldering iron and trim some solder-wick
so that the end of the piece is about 1/16" and that will suck up the
solder bridge joining pad 12 nicely with no mess.

I got the mod sheet from HRO when I bought the HT.

ARRL NEW ENGLAND DIVISION BULLETIN

(For distribution to the New England Amateur Radio community)

NEW COMMITTEES FORMED AT JULY CABINET MEETING

At the New England Division Cabinet meeting held in Manchester, NH on
Saturday, July 10, 1993, Division Director Burden authorized the formation of
two "adhoc" committees to address particular issues and concerns.
A committee to investigate and recommend to the Director a New
England Division ARRL operating award for 6M and up is chaired by Kurt Pauer,
K1PH. Kurt is the New England Division CAC member and an active member of
YCCC. Serving on the committee are: Mitch Stern WB2JSJ, SM VT and VRAC rep,
Al Shuman N1FIK, SM NH, Dan Senie N1JEB, Central Mass ARA, and
Conrad Ekstrom WB1GXM, Asst Dir.
A second "adhoc" committee was formed to review the benefits to clubs
who affiliate with ARRL and who become Special Service Clubs. The committee
will provide recommendations to the Director. The committee is chaired by
Elaine Chase N1GTB, ACC EMA and CEMARC director. Serving on the committee
are: Al Shuman N1FIK, SM NH, Rick Fairweather K1KYI, SM RI and Faith Senie
N1JIT, Pres Central Mass ARA.
Bill Mann W1KX, ME , chairman of the Division selection committee for
the" ARRL New England Division Field Organization Volunteer of the Year"
award was in attendance at the Cabinet meeting and it was announced that
nominations for this award would be accepted starting Jan 1, 1994 for
candidates for the 1993 award. The committee, made up of all the New England
Division Assistant Directors will review the applications and provide a
recommendation to the Director. See your Section Manager or call
ARRL HQ, Field Services Division for more details.

Source record: 279365

Jeff,
I think your intial question was answered well by Jack. The
antenna's characteristics change radically when comparing 40 to 10!

>Probably because "all other things aren't being equal". I wonder if the
>power into the antenna (antenna = radiating thing) is the same in each
>case. Also height above ground can affect performance. This height
>(referenced to a wavelength) varies with frequency.

>Also the radiation pattern is very different as the length (again in
>electrical degrees) of the antenna (antenna = radiating thing) changes,
>when the frequency changes.

<<!>>In short, as you change frequency, it's not the same antenna.<<!>>

Good way to say it Jack!
>73 de K9CUN, Jack

The G5RV is a variation on an antenna that was quite popular
decades ago, the extended zepp. The reason it does so well for you on
40 and 20 is quite simply, that was G5RV's intention in the first place!
Note the length 51 feet is about 2 feet longer than an extended zepp for
40 meters (.65 wavelength per leg, or 49 feet plus-minus). The length
on twenty approximates that of an extended-DOUBLE-zepp, and is believed by
some to exhibit as much as 5db of gain on that band! The impedance is
quite high (true for any antenna an even multiple of half-waves or
thereabout, and fed in the center), and the real magic of the G5RV is
that it is useable at all over a freq span of nearly 7-->1! The magic
is in the Q-section.

The Q-section (twin-lead or open wire line) is the designers
attempt to provide an acceptable match across several ham bands, which
it does. In my experience, its not 1-->1 on any band, but its useable.
If you think it doesn't work well on 10, try 30 meters sometime! You'll
see the impact of frequency and how the Q-section is just simply not
useable on certain bands due to its length being inappropriate!
>
>I mean, its certainly easier to de-tune the antenna (lengthen or
>shorten it to change its IMPEDANCE) to lower that dreaded SWR, at least
>on wire antennas. Doing so, of course changes the true "resonance" of
>the antenna, but who cares if it radiates well. The result tho' is a
>"resonant" system, and probably not a resonant antenna in the truest
>technical sense. Which, is fine for most of us, most of the time.
>If it works well, then that was the goal, right? But that doesn't
>mean what some of us say.
>

Well, when I made the comments above I was thinking specifically of dipoles actually. I believe, with the G5RV, you're better off leaving the length of the antenna @51ft. I have tried playing with several over the years, and came to believe the length is right in most cases. The Q-section length is another matter, however. Small changes in length here can make a considerable difference ON A GIVEN BAND! typically with less than desireable effects on another. So its a crap-shoot really. I wonder if the legs of your antenna are in a straight line, end-to-end? The reason I ask is that I tried a G5RV several years ago on a very small lot, and therefore the angle between the legs was around 130 degrees instead of 180! It was a terrible antenna on the higher bands in particular! It became the provebial "dummy load in the sky" as I recall, and for years I didn't have much of an opinion of the G5RV.

>>I have a shortened (51 ft) G5RV that really gets out on 20 and 40

A "true" G5RV is 51 feet, so yours is not "shortened" at all.

>>meters and but isn't all that great on 10 and 15 meters. When I checked
>>the SWR on 20 it is about 2.7:1 more or less across the band. 40 is a lot
>>worse as is 15 and 10 meters. However it loads up great on 20 and 40
>>and works great there. It will load up on 15 it doesn't work all that
>>well and 10 is worse then that. My question is why doesn't it work as

What are you comparing it to on 15 & 10? How do you know its not working well if you aren't? If what makes you think its not working well up there is signal levels you've been seeing recently, don't worry! The upper part of our HF spectrum is generally in the doldrums at this time of year, plus the Cycle 22 demise has been very dramatic. Over the next several years, 10 will peak up a bit during the fall and spring (the equinox periods), but otherwise high latitude paths will be gone for quite awhile in that part of the spectrum.

>>well on 15 and 10 as 20 and 40 do? As a antenna itself doesn't actually
>>have to be resonant on a frequency is it just radiation efficiency
>>that determines whether a antenna works well or not? I am not really
>>sure why two antennas, both non-resonant, will have one that works
>>much better then the other one. Thanks for any answers here!

Also, as Fred, KD4II commented, the length on 10 meters makes the antenna quite directive. It is about 2 wavelengths long on 10, which would make the most favorable radiation lobes around 35 degrees to the plane of the antenna, not broadside (90 degrees). So orientation could also be a factor as Fred suggested.

So if it works at all be happy! and make lots of QSO's on 20 & 40!

> It may be petty of me, but as far as I'm concerned, just wait until one
>of those communities needs disaster relief communications. I suppose I could
>even say I have a valid reason for that; with this recent court decision
>holding that ham radio is a nuisance, I could even get sued for using my

Cliff raises some important issues, and I wonder about them, too. First,
my understanding of the nuisance suit is that it was based upon a covenant
in a deed....but I suspect some judges might find ham radio a general
nuisance. Too much to go into here, but such a decision should not stand
for long, because nuisance law (at the common law level - i.e.; without
a special covenant about it) is about "unreasonable activity or condition
on the defendant's land that substantially or unreasonably interferes with
the plaintiff's use and enjoyment of his land". (See Cunningham, THE LAW
OF PROPERTY for more info.) The key legal term is "unreasonable" -
and this would include proper filtering for the TV, how clean the ham
transmitter is, etc.

BUT, the MORE interesting point here, and one which bothers me a lot, is
the one about hams being 'needed in an emergency'. I was part of a real
disaster in 1972 (the Flood of Hurricane Agnes, I was in Wilkes-Barre,
PA.) and hams were somewhat important to a few local communities for
about a day or two, until other lines were in place. I would say that
we really helped to some degree, but it was very temporary.

1. NOW, do communities REALLY need us in most emergencies? Don't most of
them have repeaters just as good, and operators just as good, and don't they
keep jammers off their repeaters better than we do? I am curious about
all of our perceptions. I KNOW some of the local communities here in SoCal
have very sophisticated emergency communications setups. The only real
selling point for hams is that they cost very little to use. That is
one reason why, here in Irvine, the community actually supports a repeater
and other activities of the Irvine Disaster Emergency Corps (IDEC) which
does a pretty good job of recruiting and training local hams for disasters.

I can imagine times and circumstances where hams will come in handy, yes.
But, do the communities really need us? Are we truly trained to work
in a directed net well enough to pass emergency traffic in general?
(I know of some really well self trained hams in this area, but my

general impression is not very good for the rest of hamdom). Are we truly organized, in general, so that hams could put something useful in place - anywhere in this country? (Please, no flames based on anecdotes....I KNOW that there have been some notable efforts and hams have done some wonderful things. That is one reason why I have been a ham for 25 years and involved in RACES, ARES, and other services.)

2. Do you believe the PUBLIC sees hams as a national resource? This is, perhaps, even more important than our actual value....in that this country seems to be working towards political power for organized groups who seem to go for whatever they can get from government. What happens when some groups really get the idea that they want/need the HF, VHF and UHF spectrum from us? Are there good, convincing, believable arguments to keep us around?

Again, I am not suggesting we are not a national resource, as I think we are (rather limited though). I am just curious about perceptions of the general citizen, and how we affect them in our everyday ham behavior and our publicity. How much effort are we willing to expend to get things moving, and keep things reasonable?

THIS stuff has sat on my brain ever since coming to SoCal. It is sometimes hard down here to imagine a good future for ham radio, as I listen to the .435 machine, or the intentional jamming on the (former) earthquake repeater after a dangerous earthquake. Pretty disheartening. Are there any long term goals and solutions? (Besides the small congressional 'pat on the back' we are getting from Charles Robb, et. al. which is a real GOOD thing!)

Just rambling today.

Clark

Worked him a while ago and send a qsl with irc direct. He was very prompt
and within a few weeks I got his card. It is beautiful card with a
picture of a tree and some people in a sunset. If I remember correctly,
I used 93cba.

4803. DJ-580 mod

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-13 16:42:52 UTC
From: jlong@emcnext2.tamu.edu
Message-ID: <21uomc$erj@tamsun.tamu.edu>
Source record: 279369

Howdy folks,

Can anyone help me sort this out...

Previously it's been mentioned on the net that newer DJ-580's seem to have less intermod problems than older units, and that Alino will "mod" the older units free of charge - under warantee. (sounds good so far :-)

I called Alinco this morning (7/13), to see what the turn around time was, and in the course of the conversation, I was told there had not been any manufacturing changes, but that they would reduce the front-end sensitivity of my radio if I so desired. (Turn around - BTW - is 5 to 10 working days).

Basically they said that the DJ-580 as shipped had high sensitivity (more so than other similar radios), and that if I was in a larger city, they could retune it to reduce the sensitivity & the intermod. It would seem, however, that overall performance would be reduced as well.

Being relatively new to all of this - I'm not sure if I want to have my radio changed or not. I live in a relatively low-pop area (Bryan/College Station - 100,000), but I sometimes notice the intermod when I'm in Dallas or Houston.

Anybody care to comment or make a recomendation? I've got till October to decide before my warrantee runs out.

Thanks and 73

I was wondering about this the other night. I think that while most people
have heard of ham radio, nobody but hams seem to know what it's about. Many
think that it is simply worldwide communications on HF, some think that it's
some type of CB and some equate it to shortwave listening. It seems that
some type of public awareness campaign would be in order. I'm not sure how
this could be presented to the public or how it would be funded, but such a
campaign should briefly describe several aspects of the hobby and emphasize
the public/emergency service functions. Perhaps a full page ad in one or two
magazines such as Time or Newsweek or in major newspapers would help. TV
spots would certainly be helpfull and perhaps could qualify as public service
ads, unfortunately that would mean that they run late at night. Funding is
certainly the major roadblock - perhaps the ARRL has looked into this...

I'm sure it was just a case of mis-understanding what I said, but last night I went into Radio Shaft to buy a 6V lantern battery (the large "brick" with the spring posts on top) . . . the sale person "puppy dogged" up to me and asked "Is there anything I can help you find?" . . . to which I replied "6V lantern batteries!". . . he immediately walked over to and reached towards the flashlight BULBS and asked "Is it a screw-in or a bayonet base?". When I repeated "Batteries" he stopped for a few seconds, so I added "The thing that SUPPLIES the power, not USES it!" and he finally got it!

Jeff,
Geez! Just re-read your last, and I need to be sure I didn't assume something here. When you said "shortened" -51 feet- did/do you mean your antenna is 51 feet long end-to-end? versus 51 feet per leg!? The number 51 feet kinda' stuck in my mind, and since that is the usual length PER LEG of the G5RV, I thought thats what you meant! If your antenna is only 51 feet long total, then its not a G5RV. Rather, its an adaptation of the original design by someone else. What are we talking about here, just for a sanity check!

>
>>
>>How do you enable tone burst? I called Yaesu a few months ago and they had
>>no idea, and I haven't seen a mod to do that elsewhere, only the extended
>>transmit and receive mods (which were, as you say, easy, but you need a
>>soldering iron with a tiny tip).
>>Post Office Box Box 281107 San Francisco, California 94128 USA

>Enable tone burst by jumping pad 13. Then you push the button called
>Monitor(Burst) described on page 6 of the manual (RTFM).

Wrong. jumper pad 13 is closed from the factory. Removing this pad gives
extended tx/rx, removing pad 15 when pad 13 is removed removes tx, but
leaves rx enabled.

Perhaps you meant another pad?

>Yes, use a small tip low power soldering iron and trim some solder-wick
>so that the end of the piece is about 1/16" and that will suck up the
>solder bridge joining pad 12 nicely with no mess.

Jumper 12?

>I got the mod sheet from HRO when I bought the HT.

The first mod sheet HRO had talked about J13, but then they sent
out an update which was for extended rx only (i.e. it said to
remove both 13 AND 15) but didn't mention just removing 13 for
ext. tx.

I'd appreciate it if you could post the details of the mod sheet you
received if it differs from the above, especialy useful would be a
mod to eliminate the fixed 12.5Kc step in the 800-950 range, even
nicer would be something enabling a 30Kc step. Of course, I don't
know how that would be useful, but it would be nice to have :) :) :)

>consists of three people) receives around 10 to 15 calls a day
>from people who are faced with overly restrictive ordinances.

OK, so make it available on line for those with net access,
and/or for those who could dial up to some sort of server at
HQ OR available on floppy disk to some nominal cost. Perhaps
instead of offering the entire list on disks, divvy it up by call areas,
e.g. a separate disk set for 0, 1, 2 etc. That would cut down the
cost and number of disks per customer.

>It's a physical impossibility for ARRL HQ to stay up-to-date on the
>various antenna ordinances of all towns and cities in the US. First,
[some stuff deleted]

Then don't do ALL towns and cities, just the ones with reported
problems that are severe enough to attract attention. That's really
what we're after here, isn't it?

>. Third, if
>ARRL HQ maintained such a list and a particular ordinance changed,
>we could be giving out potentially wrong information if we're not
>notified of the change.

Then why don't you just attach a disclaimer of responsibility
such that the individual user should verify the information before acting
upon it? Create a form that any involved ham can send back to you
through the mail advising you of changes and who the local responsible
authority is.

>The best course of action for anyone faced with town zoning ordinance problems
>is to contact your local Zoning and Planning Department and ask
>what the limit is for Amateur Radio antennas. Make sure you

Well if half of them knew what they were talking about or
didn't bullshit you this would work fine....

>specify Amateur Radio because PRB-1. the Federal declaratory ruling,

>to accomplish the local authorities legitimate purpose.
>Covenants and deed restrictions are excluded from the PRB-1 ruling.
^^
Exclusions and localities that don't give a rats ass about
PRB-1 are a good reason to start a "shitlist" or whatever you want
to call it. Just shoving PRB-1 at someone doesn't seem to mean squat,
and to the individual ham it says "go spend the next 5 years of your
life in court or in zoning meeting after zoning meeting".

>One of the many membership services ARRL HQ offers is the "PRB-1
>package." HQ is only able to send out this large 150 page package to

IMHO, the league needs to address these kinds of concerns. Keeping
a publically available database of communities where there are KNOWN
problems would be of tremendous benefit to a great many hams. In
this day and age of very high computer power at a much more affordable
price, such a database shouldn't be too difficult to work with. If
cold hard cash is a problem, solicit a donation. Surely there are enough
well-to-do league members out there that could help.....

Newington CT July 1, 1993
To all radio amateurs

SB DX ARL ARLD034
ARLD034 DX news

Thanks to Larry, WA9MAG, and the Northern Illinois DX Association for the items in this week's DX bulletin.

CHAGOS ISLAND. Jim, VQ9AC, on Diego Garcia, is quite busy on the air and plans to be active through July 10. Catch him on 14030 kHz at 1500z, 18084 at 1805, 18150 at 1718 and 21030 at 1422. QSL via WN8O.

SARAWAK, EASTERN MALAYSIA. 9M8ZZ can be found around 14200 kHz most days at 1500z. QSL via PA3FWG.

SAINT PAUL ISLAND. Duane, WV2B, is planning a DXpedition for July 9 through 12 with an emphasis on the WARC bands. Some 6 meter operating may take place. Please indicate your county on your QSL card. QSL 1993 CBA.

ERITREA. The DXpedition by K5VT, JH1AJT and DJ9ZB has been rescheduled for August. This one week operation will include three full stations, 80 through 6 meters, and operate CW, RTTY, and SSB.

Heard and worked in the midwest include

GJ2FMV 10103/0450
TL8NG 10105/0410

W3GRF SK. Len Chertok, W3GRF, died on June 24 at the age of 71. He
was one of the all-time great contest operators and a real ham.
Some of the greatest DX contest battles of the 1950s and 60s were
between him and former ARRL President Vic Clark, W4KFC. Both of
them steadfastly stuck to bug-sent CW and you always could recognize
them on CW by their fists. In his later years, despite poor health,
his station was a training ground for neophyte contesters. Lenny
was a long-time member and former president of the Potomac Valley
Radio Club. He was an ARRL life member. The funeral was June 28
and burial was in Cheltenham, MD.

>> None of the other channels are being affected, but Channel 6 is a fairly
>> weak signal. And, its a Cable channel.
>>From a frequeny chart I have it says that the 3rd harmonic from CB radio
>falls on ch 6.

Question: Is the interference occurring on a TV that's hooked to Cable TV?
Cable is supposed to be a closed system, electrically speaking.

I have heard of CB'ers hooking up their radios to the cable, and
being able to talk all over the city with (WOW!) no interference!

Just that I didn't quite understand the original circumstances.
Is the receiving TV on an antenna or on cable?

Well Cliff, as much as I agree with the sentiment, I hate to see
anyone actually do this.

I suspect that a positive and well-publicized effort after a
major storm or other disaster would get far better effect or could be
manipulated to far better effect than by standing by and watching people
getting slaughtered.

What we hams really need is to get together (SOMEBODY needs to
provide the leadership on this....like some organization) and go after
this thing by the throat. Not in a nasty, ill-mannered way, but with
good sound information and evidence on what good communications
can do when it isn't interfered with by petty zoning restrictions.

But it's gonna have to be a LOT of us hams if we expect to do any good.
Not just a few vocal ones, but a LOT of us. Which means us vocal ones
are gonna have to nail down the complacent ones to get their help.

>bill KB3YV

Bill, with all due respect, it is precisely this kind of attitude
that isn't going to help one bit.

"The general Public doesn't know who you are, what you are or what you do."

That is nobodies fault but our own, and we can change that by getting
ourselves some positive publicity. It just isn't that hard to do!
We need to hit the newspapers every opportunity we get.

The framework is there, via clubs in local communities, and for those
who are ARRL affiliated they can communicate upwards and sideways to
other groups. Quite frankly, IMHO the league should be taking more of
a lead in this - but I can also see from their perspective that if
the local groups are too busy sitting on their complacent fannies nothing
that league says will mean much. I *do* think they could TRY to
stimulate things just a bit.....

And in all fairness to the league (which I have slammed more than once) they
did have some PR radio spots a few years back, around 1977 or 1978,
for distribution to local broadcast stations. ONe of them featured
Lorne Greene (hey, a little name recognition there....never hurts)
talking up Amateur Radio.

At the time I was Station Manager of WLAY here at Purdue, and yes, we
played those spots.

Unfortunately, I think the whole thing collapsed from a large case of
ham intertia.

Let me tell you though, there are oodles of hams who work in broadcast
or in recording studios that do radio production work. FIND them.
If you have them locally, see what it takes to get some PSA spots
made (hey, some of these guys will even do them in their spare time
just because they're hams and maybe just might want to help!) and put on
the air. Use them to plug Amateur Radio. Use them to announce local
activities. And keep going......stuff like this can't just be allowed

to die of inertia.

Amateur Radio needs good PR right now, maybe more than ever. But if each one of us just sits back and stares at the old CRT here and figures somebody else will do it, it won't get done. And there will be MORE restrictive zoning, and we will lose more spectrum without a fight.

As I said before, it is up to us hams to more creatively use
the resources that we have. More specifically, 500,000+ hams that
come from all professions and backgrounds and have any number of useable
talents.

Half a million people, or whatever the current US count is,
is NOT a group that should be sneezed at. If we let it happen, it
is our own fault.

>That is nobodies fault but our own, and we can change that by getting
>ourselves some positive publicity. It just isn't that hard to do!
>We need to hit the newspapers every opportunity we get.

The problem is that for the most part, the general public couldn't care less if someone else's rights are violated. They are only concerned if their own is violated (as I demonstrated recently on this forum in my last post about autopatches in rec.radio.amateur.misc).

Another prime example is RKBA. Many people who do not own guns couldn't care less if guns are outlawed. Furthermore, even among gun owners, many couldn't care less about gun control measures as long as their own guns are not affected.

As far as the general public is concerned, hams are a source of TVI and that is about all. The theoretical possibility that hams could be useful in an emergency situation is not relevent to the public.

WA7LDV recently said...

>Without any kind of recognizable character such as swing, syncopation, or
>other recognizable fist it seems like pretty sterile art to me. Kinda
>like a painting of a polar bear in a snow storm.

I've always wondered: just how did this "swing" and "distinctive fist" stuff
get started anyway? Did someone really think there is some benefit to sending
Morse code in a way that is different from the proper ratios, was it the result
of early Morse operators just not being that good at sending, or was it an
explicit attempt to inject a little of one's self into the "textbook" sending
technique? I really don't get it. I find properly sent Morse code to have a
wonderful rhythm, almost musical, and in as much as it has that rhythm and
musical quality, I see it as an art. To me, Morse code sent with swing or a
distinctive fist is like a off-pitch vocalist or the orchestra conductor who
feels the need to deliver his own "interpretation" of a classic piece: it
grates at my nerves, makes it difficult to enjoy and understand the underlying
"message", and is isn't what the "composer" intended.

>Hams who use iambic paddles and such might as well be using a computer.
>I can't tell the difference.

I can't tell the difference between properly sent Morse code coming from
an iambic paddle and keyer, computer, straight key, or bug. If it's properly
sent, I don't expect to be able to tell the difference! To me, though,
the iambic paddle and the electronic keyer are truly the greatest invention
in Morse code history. That combination gives a regular person a fine set
of tools to enable him to send beautiful proper Morse code, yet those same
tools allow the person to maintain that mechanical, manual connection to the
code itself. Of course, a computer allows one to send perfect code, but
completely removes the person from Morse code itself; he might as well be
sending RTTY or packet or email on a computer network.

To WA7LDV: thanks for helping me remember what's so special about Morse code...

Hi Cecil! I left out a very important factor.....I have run the antenna with full open line feed with great success. I run the MFJ 3KW roller inductor tuner and the built-in balun. There is one small detail. As you know we get a good deal of snow here in NH. My 90-year old house has no eaves troughs and about 2-feet of flashing all along the eaves area of the roof.

Well along about the time of the January thaw I get some heavy duty ice slides off the roof that requires me to park the car at the far end of the driveway and make sure my satellite dish pointed at G1......and guess what happens to the pretty open wire feeders that come to the nice big porcelin feed-thru's on my window sill? Yessiree...about the time I think the frontend FET in the TS-830S has "bought it", I discover the feeder laying on top of about three feet of snow.

My neighbor, who hates the sight of my G5RV would probably really flip if I built a little doghouse over the feeder to protect it from the ice slides so...back to coax that survives the slides. I only need about 58 feet of the stuff to reach my little decoupler at the beginning of the 34-foot open wire section. As you well know, this puts a real crimp in my 10m operation, but I do not see excessive cable heating, and operation on 18mHz is very good and not tricky to tune with the MFJ.

Not to play the antenna up to be anything more than a compromise system (which it certainly is) I have managed to get myself well on my way to a 5-band DXCC with it, plus the 75m country count (phone) is at 77.

Dave-

I had to take a new HR-2600 back twice before getting a good one! Each of the bad units had a different problem. Yours is different from either of them.

It sounds like you have a transmit RF stage that goes into oscillation when its excitation is removed. It isn't necessarily the final. If you have a counter, it would be interesting to see if you can pick up a signal, and what the frequency is. I do not recommend letting the high current remain on very long.

As far as I know, it uses electronic switching, so there are no relay points to weld. However, there could be a solder splash across a diode, or a diode in backwards, or a bad solder connection or ....

Good Luck!

Todd-

I saw one once, in the parking lot at a hamfest. I'm pretty sure it is a mobile antenna, and quite a monstrosity at that! If you want to use it in a base-station situation, you will need to find a good ground or counterpoise.

I've seen a bracket intended to mount two mobile antennas as a dipole. That might work with a pair of this type antenna, but it would be twice as large.

I don't know who made it, and I couldn't find it in the Amateur Electronic Supply catalog.

>talking about here, just for a sanity check!

The length of the shortened G5RV is 51 feet with 17 feet of ladder line to match it. I tried doing some calculations as to why 20 and 49 load up so well. What I cam up with was that the 51 foot G5RV was a 3/4 wave 20 meter antenna and a 3/8 wave 40 meter antenna. Strangely enough the antenna is 1 1/2 waves on 10 meters but doesn't seem to work all that well. This discussion got me to wondering what makes a antenna a good radiator outside of the height and ground effectsi? If height and ground is all that it took then a dummy load at 10000 feet would work great!

From: adams@chuck.dallas.sgi.com
Message-ID: <CA4JHt.B63@odin.corp.sgi.com>
Source record: 279243

Gang,

since we're into this thread, i'll inject my two cents worth.

let's look at the big picture. cw is a means of communication using
tones.

1. using a straight key to send cw is closely linked to the skill of
the operator. there is no mechanical, electromechanical, or computer
mechanism to "smooth out" and eliminate any timing of the elements.
similar scenario exists for the 'bug' also.

if you run across someone using a straight key, most of the time you
immediately recognize the "signature" of the operator. this is called
the "swing" of their fist. some people run certain combinations of elements
together. ever hear someone send CQ with no letter spacing or too large
a spacing? variable length dits and dahs? when the majority of ops were
using straight keys, everyone knew everybody else before they heard call
sign or names used. it's just like recognizing someone's voice immediately
after hearing one or two words.

if you work much cw, you get "tuned" to this. there are some people you
enjoy working and then there are others you wouldn't talk to if they paid
you. :-) while tuning across the band, you run across them then either
stay around to talk to them or go on or just listen in.

some of you prefer working someone using a straight key or a bug over
someone using a keyer or keyboard or computer. that's just a personal
preference and just fine.

at speeds under 25 wpm or so, i think the mind can tolerate some "swing"
and uniqueness. i find swing at extremes too tiring. it's just like
talking to someone with a "heavy" accent. you have to strain at every
syllable and word to get the message. when the spacing, weighting, etc.
are uniform with no large deviations, then copying is a joy and relaxing.

2. let's talk about the computer. if an individual is using a computer
to copy the code, then we have a different picture.

purists will jump up a scream and shout and i believe they are right.
the operator is outta the loop and we're really doing RTTY, AMTOR, etc.
Scott, WO1G, says that using the computer allows one to send perfect code.
that's right, but only if it's used for receiving also does it take the
person out of the loop.

when i carry on a conversation at high speeds, i guess i don't really
care about what the person on the other end is doing. we are exchanging

ideas, etc. and it's the content that matters. to me the joy in the doing, i.e. actually receiving and decoding morse between my ears. i enjoy qsos at 20 wpm just as much as 60+ wpm. i go at the other operators speed. remember, we ARE trying to have a two way conversation here. isn't the process called communications?

i have heard stories and rumors that people use computers to copy morse and after a while they'll take the computer out and do it 'right'. that's great. some people have gotten their code speed up using this process and more power to them. just always think of the computer as a crutch and you do want to get rid of it as soon as possible.

there are some "hard heads with hard hats" that hate computers and people using them to receive so much that they purposely send LOUSY CW just to keep them away. INMHO i think they run off the good operators too. something about birds of a feather..... ;-) for the humour impaired.

Again, back to Scott, WO1G comment of fists. i don't think it's on purpose that one has a 'swing'. it's just naturaly rhythm, some have it others don't. kinda like watching some people try to clap hands in time with the music. some people just can't do it no matter how much they try. in the 1800's, when telegraph was the main means of communication (it took a week to get a letter any distance - still does) in any decent timeframe, operators were trained on the job. probably taught mechanically how to send perfect code. after they got on the job, they probably got some bonus for sending lots of messages, no errors, most money collected, etc. just like telemarketing today! (i've done ACDs - automatic call distributors - for telecommunications companies) operators developed short cuts like:

1. abbreviations of most used words, thus the Phillips Code (now the Phillips-Adams Code) :-)
2. numbered messages, ARRL style of messages now
3. attention getting signals to wake up other operator(s) on the line - that's the CQ like stuff

think about it. life in the fast lane as a telegrapher! money, women, bright lights, ... no tv and no radio and probably lots of idle time. what was the telegraph operator doing in Gunsmoke and all the westerns when the sheriff came in to check on the message sent to the territorial prison or the judge? i don't remember any of them in the process of sending or receiving a message. one could really be creative with this much free time. THE FIRST INTERNET!!!! yeaa, that's the ticket. slow speed ethernet was invented by Western Union. wonder if they filed a patent? :-)

i digress, sorry.

thought for the day. next time you tune down the cw portion of the band. if you've spent any time down there, don't you recognize some of the operators down there by one or more of the following?

a. fist
b. speed
c. ac hum
d. click(s)
e. chirp
f. hard/soft keying
g. weighting

and many other "signatures"

sure you do. i knew you knew it. :-)

i now return you to regular flame wars in progress.

summary: cw - try it, you'll like it. two dits or not dits, that is the question.....

Well gang, I guess we've come a long way from arguing about whether
or not to use code to arguing about exactly how to send and receive it.
I'll add one more tip here before letting it rest.
A common practice among CW ops was to add a little flourish at the
very end of a contact:

"dit dit di-dit dit"
or
"dit di-di-di dit dit"

Which was replyed to with a "dit dit" followed by the reverse exchange.
Sorta like dapping or "giving five". Keyboard whackers cannot participate
in this exchange of course, since they only have one kind of "dit".
Paddle pushers can't do it either as far as I know, having never tried
using the infernal things.

I had an friend engineer (he's not Fred) who I observered chewing solder.
It's amazing what some people aren't aware of these days. Seems like beer
is a more fun way to do away with some brain cells.

No, but when their precious cellular phones go out because the power to
the switch is gone and the generators aren't operating they'll sure as
hell want someone around.

Look at the areas that are flooded. Do you think for one minute that the
RBOC or cellular companies are going to leave equipment that's in a
flood area running and increase the damage? I seriously doubt it.

Look at the California earthquake a couple of years back. Only one long
distance carrier was still able to get calls in and out of the area.
Even cellular is fairly useless in that instance because if their
connection with the LEC is cut, they can only talk to other cellulars.

I used to own a Yaesu FT-2400H and loved it. Matter of fact only reason I sold it is because I wanted a dual-band mobile.

It's a mil-spec radio (In other words, you can really beat the hell out of that radio).

The really neat feature of that radio is that you can use a four character alphanumeric lable for each memory. So in other words, I used to abbreviate cities down to 3 and 4 chrs like CRN1 and CRN2 for two machines in Cranston, BSTN for Boston, etc.

Power output is 5/25/50W.

I sold it to a friend of mine who's now using it for packet.

Woops.. should've said that any test I intended on taking, I've passed.
When I went and took my 4B I had no intention of taking the code but
decided to try it. I got my 4B, but not the 1C. The night I went in to
try for my 1C I got it.

Has anyone had any experience with the new *small* Kenwood TS-50 HF
mobile rig?? I'd love to buy one because they are so small and compact,
ideal for backpacking, portable, mobile use. However according to a review
I read in "Radio Communication" the Rx leaves a little bit to be desired &
the 3rd order intermod products appeared to be quite poor at only -16dB on
14 MHz!! Ranging to best case of about -24dB on the other bands.
I wonder if they are all like this, or was this just a one off, maybe a
faulty one?? Anyone else tested one? Has anyone used one on air??

4835. FT530 Tone Burst

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 07:16:00 UTC
From: R.G.Harris@sheffield-hallam.ac.UK
Message-ID: <2C43B387@cerberus.shu.ac.uk>
Source record: 279270

KD1GG writes that as well expanding the coverage of the FT530, it is possible to take the US version and enable the 1750Hz tone burst.

This is the news that I have been waiting for! I want to get one of these but object to paying the European price which is some 50% higher than in the US. If I can buy one Stateside and merely enable the tone burst that seems like a nice solution to me.

Can someone post the mod, send it to me on email or tell me where to find it in an archive?

Thanks in advance

While watching Disney cartoons this morning, one of the episodes
was with Goofy as a railroad station master. The cartoon opens with him
sitting in front of a telegraph sounder.

"dah dit dah dit dah dah dit dah"
"dah dit dah dit dah dah dit dah"
"dit"

Goofy writes the following; "Put magicians trunk on board train."

Funny, I don't remember seeing *that* abbreviation in the handbook.

J. Angus: jangus@skyld.tele.com -- "Als ik Kan", Gustav Stickley

4837. OK, What about Yaesu FT-411E vs. FT-415?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 08:29:00 UTC
From: kucharsk@solbourne.com
Message-ID: <220g4c$8k9@funhouse.solbourne.com>
Source record: 279259
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

The prevailing wisdom seems to be that I should perhaps pass up the Alinco DJ-180T in favor of something like the Yaesu FT-411E. Looking in my trusty AES catalog I find the FT-415 to be about $40 more than the 411E, but the two radios seem about identical except the 415 is only 2w with the standard batt pack (vs. 2.5 for the 411) but seems to have a boatload of extra power saving features.

So, if you actually own one of these or just have looked at them, I'd love to hear from you via email (I'll summarize to the net), especially if you've had a chance to compare the two...

(For any of you coming in late, the radio will almost exclusively be used for storm chasing/spotting/SKYWARN-type things).

Thanks again in advance!!

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
---

This article will tell you how to find the answers to frequently-asked
Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on
the 7th of each month. This article is posted on the 14th, 21st, and 28th of
every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the
rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help
beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP
and from e-mail servers. This article contains instructions for obtaining a
copy of the FAQ. It also contains the table of contents from the FAQ so
that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ---

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews

If you are familiar enough with NetNews to look through previous articles on
your system, Option #1 above may be the easiest for you. The FAQ is posted
so that it should not expire from your site's news spool until the next one is
posted. Unfortunately, some news administrators do not honor the expiration
dates meant to preserve the FAQ.

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, updated daily when changes occur
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, updated monthly (mirror of Buffalo)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

I found while experimenting with my modified DJ-580T the on air light will also blink if
you try to transmit somewhere the radio can't
like between (400-410) and (

(>480 mhz).

They wouldn't get past the first line amplifier in either direction.
And on most cable systems, that means less range than they would get
with a coat hanger sticking out of the antenna jack on the back of the
radio.

About every other time I go into Radio Shaft, I ask them to point me towards such-and-such, and they tell me they don't carry it. I then flip open their catalog, mash their nose into it... and then tell them fetch!

It is really aggravating sometimes. Even worse than the ones that don't know anything are the ones that think they know everything. Radio Shack should consider some type of incentive to learn - such as a 50 cent per hour raise for every grade of ham license starting with tech. I find that they have some fairly decent products - but they need to raise their employee knowledge level...

4843. Filter Bandwidth, not easy to mod

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 12:40:43 UTC
From: randy@cyphyn.UUCP
Message-ID: <1993Jul14.124043.16540@cyphyn.UUCP>
Source record: 279318

Mechanical filters are made by using tiny, machined metal discs, which are mounted on a wire.
The size of the disc has all to do with what frequency it will be resonant at, and at 455kc, we are talking about 3/8" dia, 1/64" thick (roughly).
The discs are made resonant at the frequency the filter is labled as, +/- a certain amount, which determines the bandwidth.
The wire leads to an input coil and an output coil, which then use the effect of magno-striction to pass the signal thru to to discs, which pass only those freqs they are resonant at.

To c h a n g e the bandwidth, would require taking apart the unit, remove the discs and re-machine them to a higher freq, matching the disc whose freq is the highest of the lot. (I take it, one wants CW passband width)

So, we are talking about somthing equal to doing surface-mount tech. --- somthing only someone wanting to see if it could be done, would dare do.

If all someone really wants is to narrow up the rig, not trying to make it seem 'original' (as for antique sets) , then consider a crystal filter, which would not be so hard to build....using W0LPS's crystals.

I haven't had experience myself, but have heard from two different people that it draws about 2 amps on receive, which would make it less than desireable for backpacking and portable battery-powered operation. I've been misinformed on other things before, though, so you might want to check this out for yourself before taking my second-hand word on it.

That happened to me one Saturday morning. My wife was in the "office," a room next to our bedroom that contains her computer and (until recently) my radios. I was in bed, half awake, and kept hearing what sounded like low-pitched CW coming out of the office (there was an opening between the two rooms at the time).

So I'm laying there, simultaneously trying to copy this CW with no luck and wondering why my wife (no call and not interested) has the radio on!

This went on for about 5 minutes until I realized what I was hearing was the floppy drive on her Macintosh! Boy did she laugh when I told her about it...

Someone on the Fidonet SW echo once posted a neat strategy for disposing of Radio Shaft salesdroids.

He said he carries in his pocket the most ancient, corroded, unusual looking piece of hardware extracted from a turn-of-the-century radio. Whne hounded by the sales type, he extracts this from his pocket, shoves it in his face, and asks, "Do you have a replacement for THIS?". The salesdroid walks away mumbling and he can then browse the store in peace.

Add also, if you do a lot of soldering, handling solder(lead+tin) and - like
some might do - eating a snack, you end up 'eating' solder.

A small amount can rub off on your hands, you grab a sandwich, and......

So, its a good idea to wash hands well, after handling a lot of solder, wether
you are going to eat right away or not.

You are correct, I should have said REMOVE jumper 13 to get rx 110-180,
300-500, and 800-950. Also tx 130-180 and 400-472.

However the mod sheet DOES say jump pad 12 for tone burst.

I will gladly send a copy of it to anyone who sends me a sase.

Well, from my operating experience (several hours with one) I can say that while the receiver SOUNDS good (i.e., has good clarity, nice audio, etc.) it leaves something to be desired for sensitivity. Plus, many of the features one expects on a receiver are not available (notch, if shift).

For my money, I'd sacrifice size and get an Yeasu FT-890. This rig has a great receiver, built in tuner & keyer, and, with the tuner, costs less than the TD-50 with the tuner. It has adjustable IF shift, an RF notch filter (vs an AF on the TS-450), a very fast antenna tuner, and is quite small. The only thing that it doesn't have when compared to the TS-450 is the cability to select which filter you want for which mode. However, the 890 does allow installation of optional CW and SSB filters, but I find the built-in filters quite acceptable.

For a small car, maybe the TS-50 would be OK. However, see if you can fit the FT-890 in your vehicle - you won't be dissapointed.

My .02 worth!

Sadly, I have the same problems trying to buy anything at Henry Radio in West Los Angeles. I'm afraid that some of thier employees are even too stupid for Radio Shack or the Department of Motor Vehicles.

The bright side is that they *never* ask me for a license. I guess the logic is that if I have money and I'm inside the store, I must be OK.

Jeff,

>The length of the shortened G5RV is 51 feet with 17 feet of ladder
>line to match it. I tried doing some calculations as to why 20 and 49
>load up so well. What I cam up with was that the 51 foot G5RV was a
>3/4 wave 20 meter antenna and a 3/8 wave 40 meter antenna.

OK! Well, I'm glad I realized something was amiss, and I was out of sync. Most of what I said applies I think, altho' some inaccuracies crept in and I caught it when I re-read your message and then what I had written. I said, "somethun's out-a-whack here". Then it hit me when I had said "2 wavelengths long on 10", which your antenna comes close to. The "real" G5RV would be actually 3+, and thats when I realized we might be talking about different antennas!

>Strangely
>enough the antenna is 1 1/2 waves on 10 meters but doesn't seem to work

Exactly! Notice that on the other bands (20 & 40) the antenna is NOT anywhere close to a 1/2 wave (or odd multiple thereof)! On 10, your version is an odd multiple of 1/2 waves, fed in the center. The feedpoint impedance will be quite low compared to the other bands, so I suspect that quite a bit of the power is being dissipated in the Q-section, and not radiated.

What you experience on 10 is similar to what happens with the traditional G5RV when you attempt to use it on 30 meters. The Q-section length is all wrong, and renders the antenna useless for that frequency range even tho' the antenna SHOULD work well, as it is actually two half-waves fed in the center. As such, it should have some gain over a dipole. But, due to the effects of the Q-section, it is essentially useless on that band. Notice that no commercially available G5RV claims to work on 30 meters! In fact, several warn against attempts to use it there! And for good reason.

Attempts to use it there, for even a very short low powered transmission could ruin the coax feeding the antenna, especially if its of the mini-8 or RG-8X variety. Which it is in most cases, by the way. The reason is the very low insulation value of the 8X's di-electric material (600V), can cause an arc-thru at high voltage points along the line. Once punctured, the coax is a goner. The reason I'm telling you this is that I did it to myself! The real problem with this is that it happens very, very quickly (at the speed of light so to speak!), and it may be months later after poor performance before you realize, or stumble onto it (which is what I did!). Hi!

Who would ever suspect it, right!? But, that IS how MURPHY works!
He lurks around for awhile,,,,,then ZAP!!!

What could be a more insidious thing to do to a guy, I ask?

>all that well. This discussion got me to wondering what makes a antenna
>a good radiator outside of the height and ground effectsi? If height and

In a word, efficency! Some believe in the concept of the "coupling"
to the ionosphere, but I never have understood that or believed it for
that matter! There was a time when most amateur's believed that the
radiation resistance of the antenna was significant in the sense that
there was some magical number that worked better than any other. What
this relates to tho', I believe, today we would refer to as efficiency.
That IS achieved in different ways, on different antennas, but basically
it means effectively coupling power to the radiator, with as little loss
as possible in the devices doing the "coupling".

There are many others however, that are equally important. Such as, what
do you want the antenna to do for you? Work DX? Talk to the boys on 75?
Have a shot at Es on 2m? In other words, what are ya' gonna use it for?
What do you expect of it? What's a "good" antenna for you, might not be
for someone else. It depends on your intended use. Some guys just wanna'
be LO-O-O-UD!!! But where? IF you expect any antenna to do all these
things well, on many bands, you'll never be satisfied 'cause that antenna
doesn't exist! There are many that make such claims, or are perceived
by many among us to offer that; but that is simply not reality. The
G5RV and its derivatives do a fair job on some bands; better on others.
But, thats the way it is!

Answering those questions will help you decide which antenna is for you.
If you haven't asked yourself those questions you'll never be able to make
a choice, or be satisfied with it if you do.

>ground is all that it took then a dummy load at 10000 feet would work great!

4858. Re: Repeater systems with multiple transmitters

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 15:03:08 UTC
From: edmitch@microsoft.com
Message-ID: <1993Jul14.150308.3415@microsoft.com>
Source record: 279294

The paging industry has used massive numbers of simulcast transmitters for years and years. One of my coworkers has described a system in the U.S. northeast that uses 154 simulcasting paging transmitters! This is the only way that paging systems (which are unacknowledged) can provide good coverage and a high probability of page receipt by the end user.

Here in the Seattle area, K7PP plans to add a simulcast repeater to his K7PP/147.20+ repeater. K7PP transmits from 2000+ feet on top of Gold Mtn east of Bremerton and receives at 4,000+ feet in the Olympics and in downtown Seattle. He plans to add a simulcast transmitter in the Port Townsend area - the 4,000+ ft receiver hears this area well but its not served well by the transmitter.

I believe the instructions indicate that the output of the DMX CPT/Decoder
can be connected to a standard FM Stereo. The unit is purely digital from
the source coding to the channel coding to the modulation. The signals
are digitally compressed signals similar to their SEDAT audio signals.
They are distributed on satellite to each cable head-end where they are
converted to the terrestrial modulation format.

>completely removes the person from Morse code itself; he might as well be
>sending RTTY or packet or email on a computer network.

There is a lot of truth to the above statement because I use a CW keyboard
and often have thought the whole process is to mechanical at times.
When I work other hams that use a computer to copy they always comment
on how easy it is for them to copy my CW while I am writing their code
down at a rapid pace. I am getting ready to switch over to keyer as
it seems that I am losing something by just typing out what I want to
send. Kinda makes it sterile in a way. I liked a straight key but since
I got tendonitis in my arm and wrist I can't use it for any length of
time. Seems that CW consists of the involvement of actually manually
sending the code and copying the code in one's head or on paper. I
think this is what hooks us CW types and causes us to so rabidly defend
CW as a means of communication. 73!

Gang,

thanks for the nice responses to my posting.

first: the world record for the reception of morse is 75.2 wpm set by
Ted R. McElroy at the Asheville Code Tournament in Asheville, NC on July
2, 1939.

last night, while looking this up in the Guiness Book of Records, i did
some calculating. using PARIS (50 elements in length) as the standard
word length, at 72.5 wpm a dit is 15.957 milliseconds in length. round
this to 16 ms. at a tone of 1,000 Hz, this is 16 cycles. allowing
2.5 ms rise time (this is what i use when i make tapes and generate
code on my workstation instead of the 5 ms recommended and used by the
ARRL on their tapes) you lose a cycle or two. now you're down to 12 or
cycles per dit. i think you're almost to the edge of the world. there
may be a few cw ops that can do 80 wpm without writing it down.

someone on the net had done quite a bit of research on how the US govt
trained cw ops for military service. does this individual or anyone else
have the text that was sent on July 2, 1939? at one time a word was 4
critters (letters to you non-texans ;-)) instead of the 5 now used.
was this the case in 1939? inquiring minds want to know. i've written
to Guiness to find out. should be on record somewhere. i knew Soupy
Groves from west texas before he passed on to the great shack in the sky,
and he was one of the participants in that great test in 1939. Soupy
beat me in the midland swapfast cw test twice before he retired from it.
the guy was good. he was probably second in the world to Ted. he had
some interesting stories about 'those days'.

the reason for the posting is to correct some crap before it gets spread
too far. Dave Ingram, K4TWJ, in "Keys, Keys, Keys" (and it's an interesting
book) on page 14 he gives the world record at 77 wpm. NOT. NO WAY.

probably the best man today to beat the record is Harry Lewis, W7JWJ,
Western Washington SCM. i think he was one critter off his last try for
a world record of 78 wpm.

if you can get your speed to 30 wpm you'll be in the top 10%. 40 wpm
will probably get you into the top 2%. would be an interesting statistic
to get. 50% probably do 20 wpm or did at one time. ;-) :-)

someone asked about letter vs word recognition. at any speed you recognize
each character. it's just how you put them together consciously.
did you know that at the following speeds you have the following time to
recognize the critter before the next one starts?

70 wpm 171 ms
60 wpm 200 ms
50 wpm 240 ms
40 wpm 300 ms
30 wpm 400 ms
20 wpm 600 ms
10 wpm 1200 ms

darn it, isn't math just wonderful. 5 critters per word gang. 60 seconds
per minute. the rest is left as an exercise for the student.

ok. now quiz time.

1. when should you get away from the Farnsworth spacing?
2. what does the rise and fall times for computer generated code look like?
Supermorse? others? PC vs. Mac vs. ...? i use a DSP processor in an
SGI workstation. it's generated at 48KHz rate and it's a pure sine
wave with shaped 2.5ms rise and fall times. compare this with the cw
waveforms shown in the ARRL Handbook. close? anychance of being
close?
3. do you use Supermorse or whatever to generate tapes?

darn it. i should write a book. ARRL interested? anybody interested?
i didn't think so..... ;-)

back to your regular programming..... dit dit

WAIT: forgot. the world record for sending with a straight key is
35 WPM set on November 9, 1942 by Harry A. Turner a Camp Crowder
MO. He was a member of the Army Signal Corp. talk about cramps!
do this for two or three minutes. ok. i'm outta here.....

4863. Tips for learning the code

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 16:26:07 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9307141627.AA14100@netmail.microsoft.com>
Source record: 279283

The following is a random summary gleaned from INFO-HAMS over the past
year. No attributions -- I didn't keep them (but all the major
contributors are here I think!). Hope people find this useful.

The most important point: a positive attitude. You must KNOW that you
are going to learn the code, even when you get dispondent. Otherwise
you'll find it extra difficult.

Kevin Purcell N7WIM / G8UDP
a-kevinp@microsoft.com
Sit simplex, stulte!

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code"
Technicians realize they can add more privileges to their license if
they learn Morse Code. The following list of suggestions should
be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever
you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character
plateau at 10 WPM by listening to the fast Farnsworth-paced
"beat" of each letter and the "beat" of common words. (See the
question on Morse code speed for more information on Farnsworth
pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters
behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test
may be in either format. (If you only practice one, you may fumble
on the other.)
* Most of all, don't give up! Recognize when you reach plateaus
and keep trying until you break through them.

---

5 - can count dits and dahs, and has memorized the CW table
9 - absolute maximum a human can ever reach without the CW ears
(hearing `sound' and directly relating that to a letter,
but rather hearing dits and dahs, doing mental table lookup
and translating that to spoken/written letters)
13 - The point *just* before hearing words rather than just letters.
18 - throws away paddles because doesn't want to build up muscles
anymore. Can copy anyone below this speed SOLID, hears

cuagn sn, hw, fer, solid, shalom/god bless, good, john, joe,
don, harry, dick as words).
20 - *must* be hearing words, still ends up copying some words as a
series of letters (copy of less than 7wpm, and around 15wpm is
sketchy at times :-)
40 - ltrs? wht r thy? fer chrst saik spk nglsh

>I have been practicing CW about 15 min. a day here on my computer terminal.
>I seem to be stuck at 9 wpm. I practice at ~13 wpm. Every time I hit an
>e my brain just looses it. I don't have enough time to listen, write the
>"E" down, and by that time I've missed the next letter. What do I need to
>do?

Try copying faster code. Don't worry if you miss letters. You're
trying to break the habit of decrypting individual sound groups as
letters and develop the habit of hearing letters as complete sounds.
13 WPM is too slow for that transition for some people.

>Every time I hit an
>e my brain just looses it. I don't have enough time to listen, write the
>"E" down, and by that time I've missed the next letter. What do I need to
>do?

I had exactly this problem when I was going for 20wpm. "E", especially,
takes only one dit, but requires 4 strokes of the pencil to write. By
that time, the code had gone on, and left me in the dust. What I found
worked, was so simple that I was embarassed: instead of writing down "E"
(upper case, 4 strokes) I would write "e" (lower case, quick squiggle).
Likewise with "A/a". Sure, my copy looks funny, and I'm not forming my
letters the way the books tell you to, but so what? As long as I can
tell the difference between my "e" and my "C" and between my "a" and my
"O", I can figure out what I meant. Of course, for an exam, I would go
back and make sure the difference was obvious to the examiners who might
be checking for that elusive one minute of solid copy.

So, I would recommend that you experiment with the quickest way of
writing each character. It might just make the difference! Good luck.

Your case is very common and natural in learning code. There are 3 break
levels that we now of and thay manifest thamself like hiting brick wall.
You feel " stuck " no progres and confusion/depresion sinks in.
The levels are 7-9 wpm, 15-17 wpm and 23-25 wpm , after that it is clear
sailing up to 55 wpm.
The only way , that I know, was brute force.... you just continue and in
few days you will sudnely forget all about it. AS a matter of fact it is
not uncommon to find yourself coping 10 or 11 wpm.
As to the specific E case you are lucky, most of my students have problem

with C,Q,L,Y, so one way to practice specific caracter is to have additional
15 min. a day and listen to tape at high speed in your case 14/16 wpm and
write down ONLY tha caracters of interest purposly skipping the rest of msg.
in your case E and/or any other that you feel weak on.

>Try this: Stare into space (or maybe at some spot on your paper other
>than where you are writing) as you copy. Concentrate your mind on
>hearing and recognizing letters, while your hand writes them. Of course,
>your letters may go off the lines a bit, but who cares at this point?
>Anyhow, I found this helped me to copy behind.

I second this methodology. It may have something to do with the
barain not being able to handle well consecutively processing letters
into words while also processing the on-off-keyed thingies into letters.

By concentrating just on the letters, I seem to be able to copy faster;
it may work for you too. I am also less tempted to go back and correct
errors -- a fatal mistake, I find.

Sort of silly since it is words that you want to understand in the end,
but if it helps you pass the exam, what the heck.

Being severely near-sighted, I simply take off my glasses when I copy;
that way, I can keep the lines straight :-). Another method is to
use a keybord to copy and not look at the screen (worked well for me
until I started copying code faster than I could type :-) when you
are practicing.

Another thing: try writing smaller. You can form characters faster
that way. I find that when I write at a slant (sort of italics), I can
also write faster. And, don't form block alphabets. Use lower case
script writing. Afterall, historically, script writing was invented
so that the scribes could scribe faster.

> >Several people in this area, KD1NR included, were able to pass their Element

>
> As usual with people who have a particular approach to life which they think
> God has personally passed on to them, you have jumped to a general conclusion
> from a few observations.
Not to continue fanning this flame, but it seems the "pot" is calling
the "kettle" black here.

You seem to make some good points here, but leap to some ill-founded
conclusions of your own. (As I am no doubt doing, even as I type1 ;^)

> 1) theory is easy for some people and not for others
> 2) code is easy for some people and not for others
Yes, this is how it seems to work. Now, how should YOU, with a CW learning

difficulty, address this issue, given that you seem to want to copy 13
or more wpm? Right and Left brain-ness isn't the drill here. What you
DO with your brain is...

> For 6 months, I have been studying the morse code. I work at least 1 hour
> per day in 30 min sessions.
I believe, and experience at teaching CW would bear me out, that 30
minutes at a stretch *TO LEARN* is too long. 4 15 or 6 10 minute
sessions would actually allow you to progress faster and become less
frustrated.

> I have the ARRL tapes, some other company tapes,
> morse by rythmn and self hypnosis tapes. I also attend a class that is also
> allowing me to practice a little.
Just a guess here, but I think you have four or more DIFFERENT tapes,
each with a slightly different sending speed and character spacing to
achieve the speed you are trying to copy. This means you are actually
trying to learn CW as four or more manifestations of language rather
than ONE. SLOW DOWN. STOP!!! Get a grip and go at this in the easiest
and best way to learn ONE language, not four or more!

You have SuperMorse, so I'd recommend you focus there. READ the doc...
it is quite good on what happens with "Farnsworth" character
development and will help you understand some of this approach.

Then, crank the character speed UP to about 23 wpm, and set the word
speed at about 7...always a little faster than you can copy solid.

Next, get yourself some graph paper to copy on...

Then, and this is the MOST difficult part, learn to forget and let go
when you miss a character. Can't write the character you heard? Skip
the box on teh graph paper and move on. NOBODY has to be perfect
copying Morse...the test only requires 70% comprehension, and if you
can let a character go, by playing "Vanna White" you can probably
figure out what you missed LATER -- do NOT try it when yo are copying!

Now that you have given yourself permission to not be perfect, and the
session is only going to be 10 minutes long, there is even a chance
you could make it fun... try short e-mail messages, fed to SuperMorse
as files to send...Thought of the Day makes for great practice, and
keeps things fun. Sure, if you have read it before, you may recognize
the text as it is sent, but after a while it won't matter anyway.

Make this fun, because it can be (and is to some people)...
Personally, it took a long time (20 years of frustration and a few
abortive attempts at 20wpm) before I finally let go of having to be
perfect, and when I could be less than perfect, I passed!

Enjoy the CW... It is different, part of the romance, history and
heritage of Ham Radio, and what separates us from people who can
merely trade money for a license to yak...

> So, don't tell me how easy it is to learn the code and that some people you
> know did it after studying a couple of minutes. Great for those people!
And very irrelevent to the one person that counts.... you!

> I'm now a ham (as soon as the FCC does its part) and proud of it.
Congratulations! Welcome to the hobby.

> I intend
> to upgrade as soon as I can get past the code obstacle. It isn't easy but it
> is worth it.
The second half of that attitude statement will work for you. Treating
teh Morse requirement as an obstacle rather than an opportunity will
keep it so...

The thing that I have found most useful is to increase your
wpm speed as soon as you start copying 50-60% of the text
correctly. And then occasionally slow it back down to give yourself
the satisfaction and encouragement of seeing your improvement.

Also I have found that when just learning the letters it was best just
to do short sessions at a sitting so that you would not get discouraged.
And once you have mastered the letters, numbers, and prosigns you can
start doing longer sessions (20-30 minutes).

I am dyslexic I have worked on the code for 30 years with not much
success. I got up to 5 wpm on Super Morse. Started working 15 meters
and got it up to 13 went to 20 meters and finally passed my 20 wpm.

Learning code for me was very difficult. Actually using code is a lot
more fun to me than listing to a computer spew out code. CW is a
little frustrating at first but nobody is going kill you and eat you when you
ask for a repeat. Keep after it and it will get easier.

Even with a perfectly rhythmic fist, there are still a few personal touches
that can creep in with a straight key; a burst of enthusiasm about a topic
may cause the speed to creep up, HI gets sent fast enough to sound like a
chuckle even if the rest of the QSO is 5WPM, and so on. That said, though,
I've heard some "swings" that would curl your feedline :-). (And bugs, UGH!
10WPM dahs and a plethora of 35WPM dits...)

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment

Have any of you attempted converting existing 49 mhz walkie-talkies, cordless phones, etc. to 6-meters? I have an urge to give 6-meters a try, but don't want to spend big $$$.

On a related note: Are there any inexpensive 6-meter transmitter/ receiver/tranceiver kits out there? What modes are most common (AM, SSB, CW, FM)? Is very-low-power operation practical?

: I have an Alinco DJ-580T that seems to be having a problem. SOMETIMES when
: I key up the radio, it indicates it is transmitting but does not. It
: won't even kick my linear amp into transmit. Also when the

I had a similar problem once and after my dealer examined the rig he said
that the antenna connector was broken inside the rig. I also managed
(therefore) to blow up the main amplifier.. It was all in the warranty,
and because the dealer was unable to replace the module (reason unknown) he
sent me a brand new rig.

: transmit problem is occuring the radio fails to receive anything, even
: when I know a station is transmitting on the frequency. I have
: tried various anttenas. No luck. One other piece of information...
: When the transmit problem occurs, the "ON AIR" indicator blinks
: instead of staying on. What does this indicate?

I don't know about that as I didn't check if my ON AIR blinked or not.
The blinking might indicate that SWR is too high and thus transmitting
is disabled. This is only a guess.

: The radio is still under warrenty so I could have Alinco fix it along
: with having them do the intermod fix (which I will do anyway), but

It would be better if our Finnish importer could do the intermod fix too,
as it would take several weeks for mail to travel from here to the US and
another weeks to return.

>packet network, as well.

For what it's worth, I think you need to be cognizant of title restrictions
and restrictive deed covenants as well as local "anti-ham" ordinances. I have been looking
for the last six months for a suitable property on which to build a new residence
in Kane County, Illinois (about 40 miles west of the Chicago Loop). My understanding
is that if I have the money to plant the steel I can go to a couple hundred feet in
unincorporated Kane (still have to verify this at the county building dept.) but I have
found only one subdivision that will allow me to construct an outdoor HF antenna.
I didn't bite because it's in a mediocre school district.

A restrictive covenant is a document generated by the developer that is
recorded with the deed for a property. It is supposed to be used to "preserve" the
"character" of the subdivision. In the past the covenants would cover things
like minimum building squarefootage, building set-backs, no raising of chickens
and pigs in back yards, no rusted pick-up trucks on concrete blocks in the
driveway, etc. However, in recent years they have been expanded to exclude
everything other than a stereotypical suburban home. These things are drafted by
real estate lawyers as standardized "boiler plate" and now the standard form
(at least in my travels) always includes a specific prohibition of
outdoor antennas and towers, except, in areas without cable, TVRO dishes, which
are now very middle class items (they like their vegetables but not their hams).
The most insidious device I've come across is "architectural review". The farmer who
is cashing out his cornfield sets up himself, his wife, and their "successors and
assigns" as the subdivision's architectural review and aesthetics overseers. Before
ANY structure can be built in the subdivision (including your house!), the review
committee must approve the plans. Of course, when I ask if an HF antenna is architec-
turally acceptable the inevitable response is in the negative.

Please be aware that your acceptance of all covenants is implicit in your
purchase of the property and that your neighbors have the right to bring civil action
to coerce your compliance. This is completely separate and apart from any local
zoning and building regulations. The duration of these nasty documents is generally
25 to 30 years from the date of the platting of the subdivision and they are binding on
any subsequent purchaser. Thus you can get burned even if you buy an existing house

from an individual homeowner. Zoning variances are possible (not easy) to get, and favorable changes to the regulations can happen (but only with A LOT of local ham effort) since they are legislated by the municipality or county. You're stuck when it comes to turkey deed restrictions. Fortunately, development plans and documents are public records and are available from the county plan commission and from the county recorder's office. Yes, it is a lot of leg work.

As a consequence of the foregoing, I have adopted the following policies and strategies to deal with the general anti-ham bias found in communities which I am otherwise financially capable of living in:

1) My first question is "How much?". My second question is "I need a copy of the restrictive
covenants.". When they ask "Why do you want that? It's just the usual stuff.", I do not reveal my desire erect a sky-needle. I insist on the actual document. Verbal assurances are worth nothing and "no" is always the easiest answer, especially when "normal" buyers representing an easy, no effort sales commission are plentiful.

2) I do not inquire any further on a parcel if I find a potential restriction. In addition to outright prohibitions and architectural review, this can include clauses like "no outbuildings shall exceed sixteen feet in height or be greater than 400 square feet." Any additional effort is a waste of my time.

3) The documents for any promising parcel will be reveiwed by an attorney who is familiar with real estate law as it affects hams before I will make any committment whatsoever. If this means a trip to the recorder's office to get the documents, then so be it. I am working with a Chicago area attorney who is a ham and who has handled a number of area antenna cases. The typical real-estate-closer is not an acceptable substitute for a competent specialist and the specialist is well worth his fee.

4) I will try to confine my search to older subdivisions that are less likely to have anti-ham restrictions and to more rural areas. Even though I have a lot of big-city in me, this means I will consider moving as far out as the flatlands of DeKalb County, Illinois (60 mi. west of the Loop).

I've been through one tower hassle at a previous residence and, by doing my bookwork up front, I hope to never have another.

I would just like to pass on some experiences with ARES here in Utah County, Utah. I have only had my license since March and have been involved with ARES literally since the day it came. ARES is shepherded somewhat by the County Sherrif's office here under a group known as the SCAT team (Sherrif's Communications Auxiliary). They have established emergency communications centers in almost every public agency in the county. And after the recent Response '93 simluated earthquake exercise there were 3 or 4 agencies that asked that a center be established at their centers. The county has asked ARES to establish a 911 system that goes by radio directly to the central county dispatcher since the telephone-based system gets overloaded with almost any widespread problem. They have selected one of the 3 repeaters operated by ARES and SCAT and intend to widely announce this to the entire ham community in both Utah and Salt Lake Counties in August (Salt Lake County is included because this repeater is at about 8000' and has fairly wide coverage). Amateur radio has a VERY good reputation in this area. In fact, at a recent ARES meeting the Uinta National Forest fire supervisor indicated that after a recent forest fire (ARES provides a lot of communication support on forest fires here) the crisis management team that was brought in to handle the fire wanted to take two groups of people with them when they left - the SCAT and ARES hams and the Relief Society (the Relief Society is the women's organization of the LDS church and they

caused the feds no end of headaches when they showed up at the fire with a LOT of food to feed the fire fighters and the feds couldn't figure out how to handle donated food).

I really agree with those who advocate getting involved to show the community that hams have some value. I am riding the coattails of a group that has been developed over many years but the communities here are very ham friendly - especially the local government agencies. They have seen the hams provide service that has been very valuable and are not about to hinder that resource. The fraction of hams that are actually involved is unfortunately fairly low (250 on the ARES roster in an area where the monthly testing session is passing about 25-50 Techs/month) but those who are involved are keeping the governments on our side.

Yes, its on a TV that's hooked up to Cable TV...actually its the VCR driving a monitor.

There are a lot of CB'ers in the neighbourhood.....

I solved the problem, he was using that cheap push-on cable that they supply with VCRs. Replacing it with a properly shielded piece of coax fixed the problem.

That's the difficult way to obtain the info. Difficult for the caller
who has to wait while we go searching, difficult for us who have to DO
the searching.

The EASY way is for someone to simply e-mail me with a request for
the clubs in his/her area. In turn, I will email the list right
back to the person asking. Seems simple.

I merely need:

1. A specific request for the specific free service wanted and
2. Some idea of where the person is located so I can serve him accurately
and promptly.

Source record: 279039

Hi,
I'm not Gerry and it is not a mater of finding "holes", however you missed
THE most important paramiter - ATTENUATION - .
RG223/U is a littel brother of RG214/U one of the best coax cbl. on market.
and with silver double shielding jacket it is our good friend for elimi-\
nating TVI/BCI/PHONE problems.
However RG223/U has an attenuation of 3.1dB/100ft @50MHz and 4.5dB/100ft
@100MHz.
Figure for RG214/U are1.6 & 2.2 dB respectivly.
So if you care for your power and don't wont to loose 30 to 40% of WATTS
you will be better off by using open wire line.

One of most common mistakes on coaxial cables is that same RG # can have
wide range of attanuation spec.

RG58/U has att. of 3.1,3.3,3.5 dB/100ft depends on Mfg.Prod.#
RG59/U " " 1.8,2.1,2.4 & 3.5 " "

from the log of AA6AD

> I... kept hearing what sounded like low-
> pitched CW coming out of the office...
>... I realized what I was hearing was the
> floppy drive on her Macintosh! Boy did [the wife] laugh..

My story is the flip side of this one: when I was very
young, and just getting started in ham radio, I was
puzzled to hear CW comming out of our oven! I listened
closely, and quite clearly heard a string of Vs, and the
letters NSS. Mystified, I asked a ham friend, who cleared
things up. We were just a few miles from the big
VLF Navy transmitter in Annapolis, from which
station NSS transmitted operational messages to submarines.
The signal was so strong that anything from a squeaky door
hinge to a loose filling could pick it up. Some grease-coated
metal-to-metal junction in the oven was acting enough
like a diode to pick up the multi-megawatt signal. You
just never know...

Hacker@Virginia.EDU (Jon Gefaell) Responds:

>Why not make this package available via mail server, FTP sites, and such?
>I'll deal with the cost of printing, if necessary, and mailing is moot.

I have received the PRB-1 package, and most of it is made up of reprints
from court records and printed articles. the package is not machine
readable unless the images of the documents were scanned. I think the
ARRL is doing fine on the distribution end of this. They just don't
want to be suddenly inundated with requests from people who do not
really *need* the package. I must admit I don't have a city ordinance
issue, but I wanted the back-up in case my homeowner's association ever
notices the two outside antennas I have up.

I did notice that several of the posts asking for better access to the
package also note they are not ARRL members. Isn't it nice enough
that ARRL makes the package available to all hams, member or not.

-- A representitive from ARRL came to a DARA (Dayton Amature Radio Association) just before HamVention. One of the questions asked of him was about the Public Relation firm ARRL hired, what had they done. He told us that a lot of good PR articls were out and had been published. I took on the challange and searched for some of this PR. I found very little in the major newspapers, I have access to search several from around the country. I then searched newspapers, using Ham Radio, Amature Radio, ARRL(even spelled out ARRL) from 1990 to present, only a few articles were located. Mo
stly to anounce classes or tests. Of course our colleagues in former Yugoslavia have received great PR for their work. I can
remember the news of the Alaska earthquake was first relayed by Amature Radio, they were heros and a Postage Stamp was even issued in their honor. ARRL needs to get that PR firm moving, get the word out, Amature Radio should not be considerd a nuisance.

In an article, yee@network.UCSD.EDU (Conway Yee) writes:

> The problem is that for the most part, the general public couldn't care
> less if someone else's rights are violated. They are only concerned
> if their own is violated (as I demonstrated recently on this forum in
> my last post about autopatches in rec.radio.amateur.misc).

As I recall, no one was *violating your rights*. You did not want to comply with the admission policy of providing the repeater club with a copy of your license. They declined your application for membership. You have a right to decline giving them a copy of your license, but then, as a private organization, they have a right to set reasonable admission requirements, and decline applications from those who do not meet the requirements. Since you are asking to use their transmitting equipment, the request for a copy of your license for their member files is entirely reasonable. You, on the other hand, were not reasonable, you were paranoid, as you yourself earlier admitted.

My homeowner's association does not permit outside antennas. My *rights* are not violated by this. The restriction is in my CC and R's that I agreed to when buying my home. Of course, I would like to change the restriction, and there is some movement. Mostly, our cable service is so bad that the homeowners have pushed through a policy change allowing some satellite dishes. The association has published statements that they will not enforce violations of the archetectual guidelines that are not visible from the street. These small steps move the association into a position where forbidding my ham antennas becomes more difficult for them.

I have a long wire stretched around
the eves of my house, and a Ringo (tm) on a rear roof section below the overall roof line of the house. I am violating the letter of my civil agreement with the association, but not the implied agreement set up by their enforcement policy. By pushing the envelope, the restriction will eventually change. There are other *stealth antenna* methodologies available, and, of course, attics.

My point is this, we routinely negotiate the area where our rights and the rights of others conflict. If you choose to assert a right (not providing a copy of your license to a radio club/installing an outside antenna), accept the consequences (no membership/buying a home elsewhere). You may find that by taking a tactical loss, (give them the copy/accept the restriction) you can be in a position to change the offending policy.

[Stuff deleted, I was long winded enough]

>As far as the general public is concerned, hams are a source
>of TVI and that is about all. The theoretical possibility that hams
>could be useful in an emergency situation is not relevent to the
>public.

And this is a perception we can and should change through our public
assistance efforts and more/better PR.

My .02 worth (end soapbox mode).

Howdy folks!

I've been looking at a couple of HTs here, and would like to know if any might have a preference. (I'm sure that you have heard this before!!) There is a possibility that I may be relocating to the Silicon Valley area shortly. I've heard that people there have a problem with intermod using dual-banders, and so I figger that I need to stick with a single bander. (Anyone care to refute that?)

Kenwood TH-28A
By far the nicest radio that I've seen, with the clock, autodialer, compact shape, etc. Will the 440 RX be a problem if I am concerned with intermod?

Yaesu FT-411E
It appears that there has been a thread on this unit in comparison with the 415. Anyone care to either summarize or point me in the direction of a summary?

Yaesu FT-415
Yaesu FT-416
Same note as for the 411.

Standard C188A
This is the slim version, and it appears to be pretty slick, but I'm afraid that I don't have enough information.

Any suggestions, comments, rags, rages, etc. etc. will be greatly appreciated. I'd be happy to post a summary to the net if there is any interest.

There are implications with mentioning money on GB2RS broadcasts - I know it
has been done in the recent past but I was once told that *all* mention of
admission prices etc was removed from the packet version of the news once
(by a member of HQ staff, not Ted). Not sure what the current RA line on
it is now though.

>server for the amateur packet network, as well.

For what it's worth, I think you need to be cognizant of title
restrictions and restrictive deed covenants as well as local "anti-ham"
ordinances. I have been looking for the last six months for a suitable
property on which to build a new residence in Kane County, Illinois
(about 40 miles west of the Chicago Loop). My understanding is that if
I have the money to plant the steel I can go to a couple hundred feet in
unincorporated Kane (still have to verify this at the county building
dept.) but I have found only one subdivision that would allow me to
construct an outdoor HF antenna. I didn't bite because it's in a
mediocre school district.

A restrictive covenant is a document generated by the developer
that is recorded with the deed for a property and it is supposed to be
used to "preserve" the "character" of the subdivision. In the past the
covenants would cover things like minimum building squarefootage,
building set-backs, no raising of chickens and pigs in back yards, no
rusted pick-up trucks on concrete blocks in the driveway, etc. However,
in recent years they have been expanded to exclude everything other than
a stereotypical suburban home. These things are drafted by real estate
lawyers as standardized "boiler plate" and now the standard form
(at least in my travela) always includes a specific prohibition of
outdoor antennas and towers, except, in areas without cable, TVRO dishes,
which are now very middle class items (they like their vegetables but
not their hams). The most insidious device I've come across is
"architectural review". The farmer who is cashing out his cornfield sets
up himself and his wife and their "successors andassigns" as the
subdivision's architectural review and aesthetics overseers. Before
ANY structure can be built in the subdivision (including your house!),
the review committee must approve the plans. Of course, when I ask if an

HF antenna is architecturally acceptable the inevitable response is in the negative.

Please be aware that your acceptance of all covenants is implicit in your purchase of the property and that your neighbors have the right to bring civil action to coerce your compliance. This is completely separate and apart from any local zoning and building regulations. The duration of these nasty documents is generally 25 to 30 years from the date of the platting of the subdivision and they are binding on any subsequent purchaser; not just the original purchaser who bought from the developer. Thus you can get burned even if you buy an existing house from an individual homeowner. Zoning variances are possible (not easy), and favorable changes to the regulations can happen (but only with A LOT of local ham effort) since they are legislated by the municipality or county. You're stuck when it comes to turkey deed restrictions. Fortunately, development plans and documents are public records and are available from the county plan commission and from the county recorder's office. Yes, it is a lot of leg work.

As a consequence of the foregoing, I have adopted the following policies and strategies to deal with the general anti-ham bias found in communities which I am otherwise financially capable of living in:

1) My first question is "How much?". My second question is "I need a copy of the restrictive covenants.". When they ask "Why do you want that? It's just the usual stuff.", I do not reveal my desire erect a sky-needle. I insist on the actual document. Verbal assurances are worth nothing and "no" is always the easiest answer, especially when "normal" buyers representing an easy, no effort sales commission are plentiful.

2) I do not inquire any further on a parcel if I find a potential restriction. In addition to outright prohibitions and architectural review, this can include clauses like "no outbuildings shall exceed sixteen feet in height or be greater than 400 square feet." Any additional effort is a waste of my time.

3) The documents for any promising parcel will be reveiwed by an attorney who is familiar with real estate law as it affects hams before I will make any committment whatsoever. If this means a trip to the recorder's office to get the documents, then so be it. I am working with a Chicago area attorney who is a ham and who has handled a number of area antenna cases. The typical real-estate-closer is not an acceptable substitute for a competent specialist and the specialist is well worth his fee.

4) I will try to confine my search to older subdivisions that are less likely to have anti-ham restrictions and to more rural areas. Even though I have a lot of big-city in me, this means I will consider moving out to the flatlands of DeKalb County, Illinois (60 mi. west of the Loop).

I've been through one tower hassle at a previous residence and, by doing my bookwork up front, I hope to never have another.

Source record: 279295

I am a new ham looking for a good HT (2m or dualbander). I have read recently many posts on the latest Yaesu and Alinco HTs and was wondering how good are the kenwood TH-28A and TH-78A. I find those models interesting because of the alphanumeric message paging system. Any comments will be greatly appreciated.

|>...
|> Curtis

--
I have not tried it around Silicon Valley, but the newer Alinco DJ-580T dual bander seem to have little or no intermod problems. I have one of the newer ones and have had no problems, even in areas which used to drive my scanners nuts. Others have also commented that the newer ones are better. I have heard that Alinco has both verified and denied that any production changes have been made to reduce intermod - perhaps they were making some other improvement and this was a nice side-effect? I have even added a high-gain duckie and have had no intermod problems...

4886. G5RV Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-14 19:55:24 UTC
From: Cecil_A_Moore@ccm.hf.INTel.COM
Message-ID: <930714115524_300@ccm.hf.intel.com>
Source record: 279293

The demon-mailer bounced my last two messages so these are combined.

>I have a shortened (51 ft) G5RV that really gets out on 20 and 40
>meters and but isn't all that great on 10 and 15 meters.
>Paul WB2OYC

Paul, I've been down the same road. I started with a G5RV and was
disappointed. I now have something akin to a G5RV and I am very
happy with it. Here's what I found:

At and above the frequency that is a center-fed full-wave (18.4 MHz
for 51 feet), there is no broadside radiation to speak of. The
radiation tends to concentrate into four lobes instead of two like a
dipole. When I realized that fact and oriented my antenna
accordingly, far away signals started coming in like magic. If your
antenna runs North/South, your 10 meter radiation will be
approximately North-42 deg-East, North42West, South42East, and
South42west at a very low (12 deg) takeoff angle which will skip over
a lot of "local" areas on 10 meters. It has a gain around 8.7 dbi in
four directions. Oriented properly, those four directions will cover
most of the land area on this planet.

TV twin-lead is not a good choice for this antenna. You need the
least lossy feed-line possible. Open-wire feed-line is best but 300
ohm ladder-line is OK. G5RV antennas and all the variations do not
violate the laws of physics. A good antenna program will give you an
idea of what the impedence of an antenna is. You can use a Smith
Chart to estimate the impedence at the coax/twin-lead junction and
then at the end of the coax. It can be extremely high or extremely
low but it will not likely be 50 ohms resistive.

>The length of the shortened G5RV is 51 feet with 17 feet of ladder
>line to match it. I tried doing some calculations as to why 20 and 49
>load up so well. What I cam up with was that the 51 foot G5RV was a
>3/4 wave 20 meter antenna and a 3/8 wave 40 meter antenna. Strangely
>enough the antenna is 1 1/2 waves on 10 meters but doesn't seem to work
>all that well. This discussion got me to wondering what makes a antenna
>a good radiator outside of the height and ground effectsi? If height and
>ground is all that it took then a dummy load at 10000 feet would work great!
> Jeff Jones AB6MB

The 29.5 MHz feed-point impedence at the center of the antenna is
around 100+j10 which gives a 3/1 SWR on the 300 ohm line. Assuming a
.82 velocity factor in the 300 ohm line, the transformed impedence at
the end of 17' will be around 500+j400, a terrible match for 50 ohm
coax. SWR will be 18/1 in the coax so you will lose half your power

for every 50' of coax. A 1/1 balun won't change things... a 4/1 balun will give a better match on 10 meters but possibly a worse match on some of the other bands.

I learned all this the hard way and took time to understand the theory afterward. I now run a 105' center-fed with 300 ohm ladder-line directly into a balanced antenna tuner and it works great. These antennas are usually non-resonant at the frequencies of operation and have a very high SWR. A very high SWR is of no consequence in a lossless transmission line so get as close to lossless as possible. This precludes the use of coax like RG-58.

73, KG7BK, CECIL_A_MOORE@ccm.hf.intel.com at Internet_Gateway

>If your antenna is only 51 feet long total, then its not a G5RV.
>Rather, its an adaptation of the original design by someone else.
>73, Paul

Paul, AntennasWest publishes a 36 page $7 TechNote #124d on G5RV antennas. In Table 2, they have "G5RV TYPE, Leg Length: Double Size = 102', Full Size = 51.3', Half Size = 25.9', Quarter Size = 13.3'". They have assumed there are different "types" and "sizes" of G5RV antennas. I have an article written by G5RV, himself, that says it is best not to use any coax on a G5RV antenna. The term "G5RV Antenna" now seems to represent a whole family of variations. 73, Cecil, KG7BK

>so...back to coax that survives the (ice) slides...73 from the Land
>of the Frozen Chosen, -=Joel - KC1SG=-

Hey Joel, living in Arizona, I entirely forgot about the advantages of coax during ice slides. If your SWR is high enough, it will even melt 'em. Coil your coax across your driveway and never have to shovel snow! 73, Cecil, KG7BK

Source record: 279300

jangus@skyld.tele.com (Jeffrey D. Angus) says:

>While watching Disney cartoons this morning, one of the episodes
>was with Goofy as a railroad station master. The cartoon opens with him
>sitting in front of a telegraph sounder.

>"dah dit dah dit dah dah dit dah"
>"dah dit dah dit dah dah dit dah"
>"dit"

>Goofy writes the following; "Put magicians trunk on board train."

>Funny, I don't remember seeing *that* abbreviation in the handbook.

Reminds me of the (apochryphal?) story of the movie that needed some
African tribesperson to come over the hill yelling something warlike in
Swahili, and when the film was distributed later it turned out that he
guy was saying (in Swahili) "they aren't paying me enough money for this
part"... (I think Patty N6BIS or perhaps Phil KA9Q told me this in a less
mangled form).

There is some CW in one of the Tony Hancock BBC shows (no, not the "Radio
Ham" episode) where he mistakes a ship-to-shore message to "(Mary) Soskins"
as an SOS signal by hearing only the first three letters of the surname,
and this is all sent correctly except that the K is sent as an R. Well,
it's closer than the 'goofy' example above.

The Goon Show (another ancient BBC series that many of us grew up with,
if that's the right expression) has morse at various places, and it's
always sending "GDM" - dunno why, but Spike Milligan (who wrote the scripts
for nearly all the shows) knew morse at the time he was in the Brit army.

Oh well.

Of course the alphanumeric message paging system only works between two Kenwoods with that feature. Truthfully I've never even heard of people making much use of simpler paging features. Consider carefully if such a feature, beyond being 'neato' is going to be of much use to you. I own an IC-W2A and FT-530, both are very good radios for very diferent reasons.

Best luck!

Hola Guillermo!

I have a TH-78A and have been very happy with it. The reason I chose it over the others were the alphanumeric channel identifiers and the excellent industrial design. I have never used the paging feature.

The only problem I've had with it is some intermod. I live in the shadow of a mountian with many broadcast transmitters. CTCSS decode helps with this. I don't know how the Kenwood would compare with the other brands in this environment.

Hope this helps!

>>file on communities that attempt to restrict amateur radio activities,
>>through antenna restrictions, nusiance suits, and otherwise. If so, is
>>this file publicly accessable?

jhennessee@arrl.org (John Hennessee) responded:
> This is a good suggestion, however, it isn't possible for several
> reasons.

John goes on to point out the organizational and personnel difficulties
of maintaining a file for online access on all communities that have taken
hostile action toward ham radio. He outlines how to find out this information
for a specific community.

As he points out, such an online file would not be accurate, would not
be complete, etc. I think, however, that it might be possible for an internet
server not affiliated with the ARRL to maintain an _anecdotal_ file, which
would contain messages such as "My neighbors in <town> sued me on <date> and
<won/lost>, details follow". Obviously there would have to be disclaimers
regarding the accuracy of the information, etc.

Rather than suggest that the ARRL maintain such a file, I was asking if
such a file existed. I think that it would be better carried out by
volunteers on the internet and packet radio than by the ARRL, since all
of the data entry and handling of queries could be handled by e-mail
servers, and any ham would be able to submit data via internet or packet mail.

I'm capable of putting this up on one of my servers if the general opinion
is that it would be worthwhile.

> George S. Thurman

Well, I don't have one but I was talking to a couple of people at
work shortly after seeing one of these commercials (wondering if they were
trying to pull a fast one or whether it only APPEARED to charge but it was
only a surface charge). I heard (possibly rumour) that battery companies
have known all along that alkaline batteries are rechargable (if built
correctly) but kept that covered up in the interest of selling more
batteries. It has also been said that these alkalines can only be charged
something like 10-20 times whereas NiCds are ~500 times. Alkalines also
have a lower internal resistance (suited for running transmitters, RC cars,
photo flashes etc...) but alkalines have a MUCH higher capacity (ie. D-Cell
is about 15Ah). There are apparently a lot of tradeoffs but I can see
where rechargable alkalines would fit in.

As a side note, my schools A.R.C. has these "alkaline" batteries
that were used as backup in commercial radio installations. I believe that
NaOH is the electrolyte. I don't recall what material is used in alkaline
DRY cells (will look it up) but.....

>As I recall, no one was *violating your rights*.

You do recall the case correctly but let me explain once again why I feel the way that I do.

> Since you are asking to use their transmitting equipment,
> the request for a copy of your license for their member files is
> entirely reasonable.

The question of reasonable is what is at issue here.

First of all, as a private organization, a club has every right to make any restrictions it wishes (as far as I am concerned). In practice, this means that the restrictions must be "reasonable". Thus, a "reasonable" requirement on a application to a modelling agency might be the measurements of the applicant (for the purposes of the fitting of the dresses). For a ham radio club, this would be considered unreasonable and would quite possibly open the club to legal action; the club has no reason to require the person's physical measurements.

As a private organization, the club is entitled to infringe on someone's rights. This, however, does not make them right. It is my claim that the requirement is unjust. My reasons for resisting are simple: one must "think globally and act locally."

The question, therefore, becomes whether the requirement of a copy of the ham license is "reasonable" or not. Some would content that it is just as years ago, some contended that it is reasonable to have certain people sit at the back of the bus. After all, there is no "right" to sit at the front of the bus and the bus gets you to your destination no matter where you sit.

Ultimately, the question is whether the requirement is reasonable. One measure of reasonableness is whether they NEED the license. Using this requirement, the answer is no. In order to access the repeater (or use the autopatch) there is no requirement for the club to have a copy of the license. Some have argued that the amateur accessing the autopatch is the control operator; as a control operator, the club NEEDS the license. This argument is false. The amateur accessing the autopatch is not the control operator. [If there are those who want to know the rational, I can post the reasons from Part 97].

Furthermore, it has been pointed out on the net that all the information on the license is public domain anyway. As such, there is no reason not to give the license. I claim otherwise; the fact that the information is available from other sources means that there is even less reason why the club needs it from me. The FCC database is more authoritative a source than my piece of paper which can be forged. The fact that the application to the club was sent to my FCC database address and the fact that the entire Board could have seen

the actual license eliminates the flimsy reason that the photocopy is needed to prove my amateur status.

In addition, it was pointed out at the Board meeting that I should give it simply because, "there is absolutely nothing that the Board can do with the information anyway". This is not a good reason to give the license. On the contrary, it is a good reason why the club has no reason to ask for a photocopy. Since there is no need for the photocopy of the license, I claim that the request is an infringement.

Another point is whether it is sufficiently important to tilt at this particular windmill. Perhaps the requirement IS wrong but the issue is not sufficiently important to fight. This is a matter of personal choice. Just remember, rights are lost by erosion in exactly this kind of manner. We used to be able to protect ourselves in our own homes; in many states, we have lost this right. We used to have freedom of speech and assembly but for many years it was illegal to believe in Communism. To this day, we are not allowed to hear specific viewpoints from foreign dignitaries.

> You, on the other hand, were not reasonable, you
> were paranoid, as you yourself earlier admitted.

As a side issue, I admitted that the refusal to submit the photocopy may have been paranoid since I had no reason to believe that the copy would be used in a manner that I would disagree with. I did not, however, admit that the refusal was unreasonable (and that the requirement was reasonable). This is the point that I am trying to raise! The time to prevent abuses is before they occur- not after it is too late.

In conclusion, some of the people following up this thread have resorted to name calling. One poster stated that if he were on the Board of Directors, he would have voted against me simply because I was a "twit". This is not the proper manner to state your case. I thank those who have responded to my post in a more rational manner. [While this article is posted to follow up a post by Mr. W. Kirsanoff, I am not implying that he has acted in an irrational manner. On the contrary, while I disagree with him, he does raise interesting points. We simply have different definitions of what is "reasonable".]

> My point is this, we routinely negotiate the area where our rights and
> the rights of others conflict. If you choose to assert a right (not
> providing a copy of your license to a radio club/installing an
> outside antenna), accept the consequences (no membership/buying a
> home elsewhere).

Here, we agree completely. There are costs to making a stand. I have decided that the benefits of resisting outweigh the costs. I choose to resist. The consequence is that I will not be a member but I also choose to explain why I believe that the rule is unjust. Hopefully, there is a club out there thinking of such a requirement who will modify the requirement to answer my arguments. Remember, the existance of a photocopy is not the only way to "prove" that someone is a license ham. If anything, it is one of the weaker ways.

> You may find that by taking a tactical loss, (give
> them the copy/accept the restriction) you can be in a position to
> change the offending policy.

Very true. Once again, this is a matter of cost/benefit. I believe that entering into a Catch-22 situation is too great a cost for the benefit of having the chance to fight the unjust rule directly.

Does this have anything to do with the impedance of free space,
377 ohms/meter? Why not extend the maximum transfer of power theorem
beyond the transmitter-antenna system right out into the "Ether"?
Is a 300 ohm folded dipole for the 2 meter band a closer match to free
space?
If it wasn't for the convenience of coax we would all be closer to
nature still.

Wait another week and I'll have my radio back - we'll see how well it works.

They told me that they would "modify" the radio, without mentioning that they
would simply turn down the sensitivity. I did notice that pager transmitters
were unavoidable with the HT connected to an external antenna, so the R.F.
gain was probably much too high.

I suspect that if that makes any
difference in range, it will be more for "scanner" uses than for amateur radio.
I was able to hear much more than I could work before, and what I heard
was probably determined more by s/n at the antenna rather than the gain of the
R.F. stages.

From: acornwal@fox.nstn.ns.CA
Message-ID: <68869.acornwal@fox.nstn.ns.ca>
Source record: 279315

A few days ago I posted a message on Info Ham Digest about my
inability to wire a PacComm TINY-2 MKII and MC-NB96 combination to
be switchable between 1.2K and 9.6K operation, and I asked for advice.
After continued tinkering, I succeeded in making the unit switchable,
as described in the MC-NB96 manual. The difficulty appears to relate to
the recovered clock trace on TNC header pins 13 and 14. When I cut
the trace, switching between baud rates became possible.

Speaking of hearing CW coming from odd places: A few weeks ago
our cable tv setup was having trouble. Some channels were terrible, u couldn`t
see or hear anything. But one channel had a blank screen, but the audio was
CW!! Not faint CW i *thought* i heard in the background, but loud an clear
RST was 599!!! I copied the CW in my head, it was just a long string of letters
and numbers that made no sense. When I called the cable company to ask what
the heck was going on, the person I spoke too did'nt know what I meant by
"I`m hearing morse code on channel 13"!!! So I just gave up and after a few
days the CW dissapeared.

Message-ID: <9307150129.AA02673@netmail.microsoft.com>
Source record: 279184

Howard VK3AYV says:

I read in "Radio Communication" the Rx leaves a little bit to be desired & the 3rd order intermod products appeared to be quite poor at only -16dB on 14 MHz!! Ranging to best case of about -24dB on the other bands.

I say:

Thats the 3rd order INTERCEPT power, i.e the power of the input signal which gives 3rd order spurious signals in the receiver the same level as first order tones.

Imagine the following test setup:

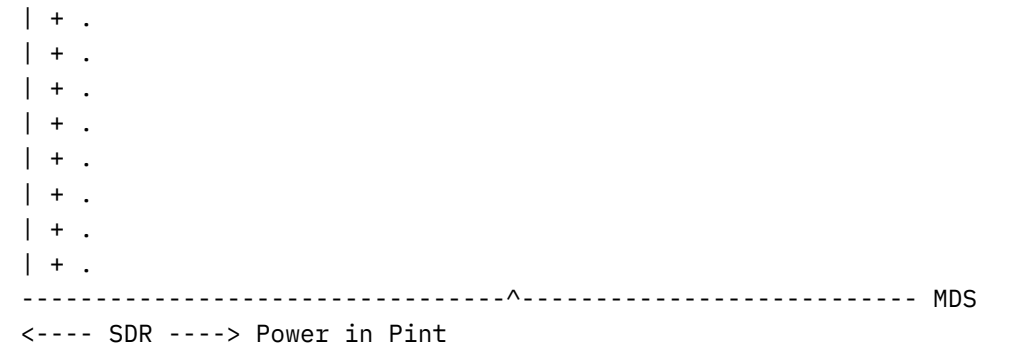
A two tone gnerator outputs two non-harmonically related tones, f(1) and f(2), which differ in frequency by some fixed amount (they'll say in the test: it'll be 20KHz, or 50KHz or 100kHz difference). You then increase the power of the sum of the two tones and measure the output from the device under test at two frequencies: one of the input tones (say f(1)) and one of the third order terms (2f(1) - f(2) or 2f(2) - f(1)). The third order signals increase as the cube of the power input, the first order signals go as the power input.

Imagine plotting these two signals on a log/log graph (measure the power in dBm):

1. power out of f(1) vs power in of f(1) + f(2)
2. power out of a thrid order IMD signal, 2f(1) - f(2), vs power in of f(1) + f(2)

Like so:

```
|
|
| . + + +
| . +
| + f(1)+f(2) . +
| . 2f(1)-f(2) . +
| .+ ^
| + |
| +. ^ |
| + . | blocking
| + . |
| + . the intercept point
| + .
| + .
| + .
```



MDS is the Minimum Detectable Signal (the power in the gives a 3dB
increase in the noise floor of the RX).

SDR is the spurious free dynamic range: the difference between the
input power which just causes spurious signals to rise above the MDS
and the MDS itself.

At high enough power the RX saturates -- this is when blocking is said
to occur (when the output signal increases by less than 1dB of the
input signal -- 1dB blocking point).

I haven't seen a RadComm review in a long time but I imagine they use
all the above terms (the ARRL does it its excellent reviews (good job, Ed!)).

This also means that the SDR, MDS and intercept point are all related by:

Pint = MDS + 3/2 SDR

(well if I did my geometry right -- this is done without a net!).

So lets say that the MDS of the TS50 is -135dBm (just a guess -- its in
the right ballpark). Then for an intercept of -16dBm the spurious free
dynamic range is 79dB. Not spectacular, but not completly useless. On
the other bands the dynamic range will be 85dB.

The ARRL handbook has a good writeup on this.

(lots of stuff deleted)

I'm inclined to agree. Poorly sent CW is a terrible strain on the ear.
When the dot dash ratio varies between 1.5 to 1 and 20 to 1, in the
same transmission, that's a little too 'distinctive' for me.

I don't usually care much for computer sent CW. I find that many op's
using computer keyboards spell out every word and tend to send long
monologs that give me writers cramp.

It's too bad the sending test has been eliminated. More and more really
bad fists are showing up on HF. I'm sure these folks can copy just fine
but they don't seem to be able to space their letters and words. I ran
into a guy (or gal) the other night that was sending CQ at about 10 wpm
in the general section of 20 meters (at least, I think it was CQ). I
couldn't figure out his/her call. (it sounded different every time he/she
sent it).

Marc-

Although I agree with your assessment of the FT-890, I still prefer the TS-50. While the Yaesu offers a lot for the money, I find it more difficult to use.

I haven't had any complaint about TS-50 sensitivity. Even on Ten Meters, the atmospheric noise is stronger than any internally generated noise. It does have a "Scotch" S-Meter. I can understand signals on Ten Meters, that don't even register on the meter.

My TS-50 does have IF Shift, located on the same shaft as the RIT control. The bigger rigs have very few features that I miss on the TS-50. I seldom use the notch filter, XIT or speech processor on my other rig. I really appreciate the LCD display that can be read in direct sunlight. Being able to set up four functions to be controlled from the buttons on the microphone, is quite handy when mobile.

However, it is only a matter of time until the other manufacturers match the TS-50. A transceiver even smaller than the FT-890 would be neat, if it had a built-in tuner.

From: ron@topaz.bds.com
Message-ID: <2229q0INNnv8@topaz.bds.com>
Source record: 279189

It has also been said that these alkalines can only be charged
something like 10-20 times whereas NiCds are ~500 times. Alkalines also
have a lower internal resistance ...

I find that last line hard to believe. NiCads have next to no internal
resistance. That's what makes them tricky in some circumstances. It's
also why NiCads are used for some applications (such as starting jet engines)
than Lead-Acid batteries.

4913. Re: What does it take to fry RG-223

Newsgroup: rec.radio.amateur.misc

Source record: 279181

Gary Coffman (gary@ke4zv.uucp) wrote:
(regarding using RG-223 to feed a high-SWR load from a 150W HF
transmitter:)
: small cable. Of course the SWR is extreme. Let's look at a more
: typical worst case SWR of 10:1. This is a value that may be
: experienced in practice with a random flattop antenna.

: Emax=sqrt(150*50*10)=273.86
: Emin=273.86/10=27.39
: Imax=150/27.39=5.48 amperes

: Now cables have somewhat different characteristics at RF than they
: do at DC. Dielectric losses are proportional to Emax, and skin effect
: conduction losses are proportional to Imax. So a cable with SWR will
: have two different regions of "hot spots". At Emax the dielectric
: will be hot, and at Imax the conductors will be hot. We can't just
: go to the copper wire tables for conduction losses because RF losses
: are skin effects and the RF skin depth is frequency dependent. Dielectric
: losses are also frequency dependent. Our best guide is the db loss
: per 100 foot value that the manufacturer usually gives us. We can then
: use the curves for excess loss due to SWR in the handbook to give us
: an idea of the amount of power the cable will have to absorb. That
: power can then be apportioned based on Emax/Emin to show what the
: hot spots will be like. In your case, the cable will handle the power.

Hmmm. Well, that may depend on how conservative you are.
"Reference Data for Radio Engineers" has a chart of max power ratings
of various RG cables in the 10-3000MHz range. RG-58, which will have
essentially the same losses, and is constructed with the same
dielectric, as RG-223, is rated at just over 300 watts at 30MHz.
This assumes 1:1 SWR, ambient temp of 40C, max inner conductor temp of
80C. The 5.48 amps is the same current you get at 1500 watts on a
1:1 50 ohm line. So I suspect the heating with 150 watts and 10:1 SWR
at 30MHz on this line could give you some problems. Admittedly, the
rating is fairly conservative, but you really should try to get
the SWR down to the 3:1 range or lower... This will also lower the
loss in the cable, which could be noticable in a long run at 30MHz.
(The center conductor heating, and the fact that Teflon can withstand
much higher temp than polyethelene, is by far the predominant reason
that Teflon-insulated coax can handle higher power than poly-insulated.
And be very careful with power in foam-polyethelene insulated coax!
The foam is a better thermal insulator, and poorer at supporting
the weight of the inner conductor...)

>it is now though.

Apologies if you (not Alan, whoever asked) knew this already (or if I'm wrong), but the rallies referred to in the RSGB (sorry, rsgb) bulletins are not car rallies in the sense that they are understood here. I think they are what would be called Hamfests here, and I would expect that the admission price is trivial. At least, it is once you have decided to cross the Atlantic in order to go to one...

I worked someone at the Longleat rally a few days ago, and he was running a portable station set up in the grounds, he wasn't whizzing around at high speed in a car.

But perhaps I have this all wrong - it has been known.

Except that alkalines have a MUCH higher internal resistance than Nicads.

>photo flashes etc...) but alkalines have a MUCH higher capacity (ie. D-Cell

This, however is true.

>...
> As a side note, my schools A.R.C. has these "alkaline" batteries
>that were used as backup in commercial radio installations. I believe that

Once apon a time, Nicads were called "Rechargable Alkaline" batteries. This
is because they use a Potassium Hydroxide electrolyte (KOH).

Does anyone have suggestions as to where the cheapest place to buy/mail order a 1200 MHz module for a Kenwood 741 would be? Or, does anyone have one for sale? Thanks much.

The ARRL Handbook always has a wire guage table in it. It give
American Wire Guage, Standard Wire Guage (British Wire Guage), and
Metric. Buy a copy, it is filled with useful electronics info even if
you are not an amateur.

If you want, you can also find this information in the book
"Reference Data for Radio Engineers" Originally an ITT publication,
now available from Howard Sams.

I must say there is one person at the Radio Shack near me (University Heights) that actually knows his stuff, and knows his store. His name is Jim. Everytime I go in, Jim knows me by name, knows the numbers to punch up on the computer so they can track my sales, and can point me right to where what I'm looking for is.

Only problem is he probably won't be with RS much longer. :(

Now, as for dense people. Jabbour Electronics in Pawtucket, RI has one old woman at the counter who I honestly think is brain dead. I went in one day looking for a replacement transistor, and not only did I know the number and manufacturer of the transistor I was replacing, I brought the dead one with me for comparison.

This woman tried 6 times to get me the right one, and I finally got so frustrated I asked her to let me see the book, I looked up the transistor, copied the x-ref mfgr's number down and told her to go get it for me. She brought back the wrong one. So 8 tries later I had the right $5.00 part in my hands. Sheesh.

The BNC on the Alinco is a weak spot, especially if you are constantly
switching from duck to another antenna. On my unit, some play developed
on the connector, followed by a break in its solder bridge inside. I
resoldered the connector (it was a major pain to get to it), and after
I reassembled the unit, I put a thin ring of Super Glue around the
outside of the connector. It's not going anywhere now. Cosmetically,
the ring of glue isn't even noticable.

From: dstock@hpqmoca.sqf.hp.com
Message-ID: <CA7Cqq.4v5@hpqmoea.sqf.hp.com>
Source record: 279200

Mechanical filters are based on the coupled resonator principle, not on classical lowpass-prototype filter design

What this means is that the disc resonant frequencies are all very close together, and that the coupling wires control the bandwidth.

The couplings do have a small effect on the freq of each disc, nd it is possible that small corrections may have been made in the initial manufacture.

You could change such filters by just mucking around with the coupling wires (and the input-output couplings or Z's) but the cost of these beasts and the irreversability of experimental changes would rather discourage me.

Beware of transducer non-linearity, a lot of mech filters were very bad for intermods.

Cheers

While the RBOC are keeping communications going in affected areas. While we shouldn't underestimate the importance of Ham Radio to emergencies we also shouldn't overestimate it. Current approaches to emergency communications by "professional" communications firms are really pretty good and relatively quickly activated in most circumstances. It doesn't do Ham radio any good to pretend that we do it all.

Ham radio is, I believe, vital in the period when the commercial stuff goes out and before they switch to their emergency mode. Also, health and welfare remains the key importance of Ham radio emergency support even if commericial provides the first line emergency commo. Then, of course, there will be times when the diaster hits so hard that the commercial bunch can't activate their emergency mode ops, Ham radio has the potential to fill that gap. This is usually less common in the US then in certain areas abroad where the commercial commo was bad or is disrupted by war.

Given that I believe we have an obligation to form partnerships with the governmental and industry groups to establish solid, rapid and diverse communications for emergencies. So places, I know, are doing just that others are doing nothing. We should take that active approach rather than take the approach "if you don't let me put up my antennas, I'll take my ball and go home and then you won't be able to play". When people see our value, and they generally don't, the restrictions will ease.

4934. DSQ on DJ-580, HELP !!!!!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 12:52:02 UTC
From: kme@node_17aa4.bnr.ca
Message-ID: <1993Jul15.125202.22653@brtph560.bnr.ca>
Source record: 279203

I have been going 'nuts' lately. I wish to use the DSQ feature on the DJ-580, with virtually NO success. I could get it to unsquelch on ONLY using the 'b' group with 000, and the DSQ (no P or G) setting in the LCD display. If I changed the code, it would no longer work. Is there anyone who can give a GOOD (which the instruction manual for the 580 is not) description of operation for DSQ on the DJ-580 ?

I haven't even thought of sending digital messages yet !!

The following is a list of informational files for this newsgroup
available via anonymous FTP from ftp.cs.buffalo.edu (currently at IP
number 128.205.32.9) or the Australian mirror at grivel.une.edu.au
(currently at IP number 129.180.4.7).

Questions to bowen@cs.buffalo.edu

1750m.band - misc info on the 1750m band
222xvtr.zip - PostScript code for KH6CP no-tune 222-MHz transverter
ampr_coordinators - coordinators for packet IP addresses
antenna_refs - references for articles about antenna designs
arrl-logo.ps - ARRL logo in PostScript format
arrl_bib - bibliographies from ARRL literature (ASCII format)
arrl_digital_minutes - Minutes of the ARRL committee on digital comm.
arrl_fo_jobs - descriptions of some ARRL Field Organization jobs
arrl_info_service - announcement of the ARRLs trial information service
cal_pd_freq - California police frequencies
callbook.tar.Z - sources for the marvin callsign server v1.3
canadian.Z - Canadian ham database in FCC format
carpet.loop.2 - Antenna for apartments and small spaces
clubcalls.Z - database of US ham clubs
comb6.zip - HF Propagation Predication program
docket_91-36 - information regarding the proposed scanner regs
dxcc-k2di - ARRL DXCC country list
element_credit - rules about VE credit for earliers exams
elmers_admin - information about the elmers list (see below)
elmers_list - list of elmers on the network
exam_ops - info on exams and exam opportunities
faq_callsign - frequently asked questions about the callsign server
faq_ham_1 - frequently asked questions about ham radio (pts 1)
faq_ham_2 - frequently asked questions about ham radio (pts 2)
faq_ham_3 - frequently asked questions about ham radio (pts 3)
faq_packet - frequently asked questions about packet radio
faq_shortwave - frequently asked questions about shortwave
fft.com - EGA/VGA DOS command for spectral display (QST 1/92)
ffth.com - Hercules DOS command for spectral display (QST 1/92)
field_day_92 - field day rules for 1992
florida_antenna - Florida State antenna law info
guide2newsgroups - description of USENET newsgroups dedicated to radio
ham_sat_sum - summary of information needed to get on satellite
hams_on_usenet - list of ham operators and e-mail addresses on the net
```

hamstacks - information about the question pool stacks
handicap_waiver - info on obtaining a handicapped test waiver
hf_rigs - QST reviews of available HF rigs
ht_info - general information about commercial hand helds
icom_ic_w21at_mods - increases the number of bands on an Icom IC W21AT
intro_to_swl - info for aspiring short wave listeners
intro_to_scanners - info for aspiring scanner listeners
jlem.zip - Program, w/source, for 2kx8 ROM emulator, QEX 01/93
j-poles - description of j-pole antenna made from twin-lead
lead_acid_batteries - essay on lead-acid batteries
license_plates - guide to ham calls on license plates
logos - PostScript logos for various ham organizations
mail_order - a database of electronic mail order shops
manufacturers - names and addresses of ham gear manufacturers
motorola_ge_service_man - how to get service manuals for Motorola and GE rigs
nasa_select - places where you can hear NASA SELECT broadcasts
new_packeteers - helpful essays for new packeteers
newcomers - tips and hints for those new to amateur radio
nprm_93_85_text - text of docket 93-85 (message forwarding systems)
packet_clubs - organizations you can get more packet info from
packet_gateways - list of gateways from packet to Internet
packet_misc - miscellaneous packet info
packet_software - list of packet software versions
phone_bbs_list - phone BBSs for ham related issues/software
pio_handbook - ARRL Public Information Officer's Handbook
pr_docket_92-136 - text of FCC PR Docket 92-136
qsl_bureau1 - information about the ARRL QSL bureau
qsl_bureau2 - "what should I do if" list for the QSL bureau
qst_prodrev - index of ARRL product reviews in QST
repeater_map_proj - description of Electronic Repeater Mapping Project
rfi_tips - good posting about RFI
sol_geo_data - desciption of daily solar geophysical broadcasts
sol_terra_terms - glossary of solar-terrestrial terms
sstv_wefax_info - general help for SSTV and WEFAX users
usenet_purchases - tips on buying and selling via USENET

For readers of this newsgroup both new and experienced, these files are a de-facto "Required Reading List" to provide definitive answers and pointers to other sources for questions that come up in this forum.

This is also your archive, so any additional articles, guides, or small PostScript graphics that you feel would enhance this collection are most welcome. Submit to Devon via his E-mail address above.

Thanks go to Devon Bowen, KA2NRC, for providing diskspace and maintaining these valuable archives, as well as all the authors who wrote and submitted the information contained in them.

Additional archives out there that have /pub/ham-radio directories are encouraged to "mirror" these files to provide redundant storage for these documents. Some of these sites (which may or may not mirror

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July weekly
August bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Scott, the identification requirements of the agreement state that you
should sign as WY1Z/VE2 ("stroke", "slash", "mobile", "portable", etc.),
AND that at least once during each conversation, or every 30 minutes, you
must identify your location with the nearest town, or significant
landmark.

That's all there is to it. And yes, Canadians must follow the same format
for identification when they operate over here.

Did u try Fair radio sales in Ohio (419-227-6573) ? They might
have these tubes and the sockets too.
Otherwise if u want to by NEW, try Richarson Electronics (don't have
their tel no. handy).

I just got a flyer in the mail from "Dan's Small Parts And Kits", in Missoula MT. It apparently is Danny Stevig, who used to run KA7QJY Components, but now under a different name and a different state as well. Does anyone know what the deal is? I sent a letter a couple of days ago, and I think I'll call the old phone number tonight to see if he really has moved, but I wondered if any of the readers here knew the story.

G5RV Antennas

>>The demon-mailer bounced my last two messages so these are combined.

>I have a shortened (51 ft) G5RV that really gets out on 20 and 40
>meters and but isn't all that great on 10 and 15 meters.
>Paul WB2OYC

>>Paul, I've been down the same road. I started with a G5RV and was
>>disappointed. I now have something akin to a G5RV and I am very
>>happy with it. Here's what I found:

Actually that is Jeff's antenna, not mine, Hi! I do use two G5RV's
however. One at my summer place in Va. and the other at home in SNJ.
The one at home is the "traditional" variety, homebrewed, and I do
use 300 ohm open wire line for the stub.

>>At and above the frequency that is a center-fed full-wave (18.4 MHz
>>for 51 feet), there is no broadside radiation to speak of. The
>>radiation tends to concentrate into four lobes instead of two like a
>>dipole. When I realized that fact and oriented my antenna
>>accordingly, far away signals started coming in like magic. If your
>>antenna runs North/South, your 10 meter radiation will be
>>approximately North-42 deg-East, North42West, South42East, and
>>South42west at a very low (12 deg) takeoff angle which will skip over
>>a lot of "local" areas on 10 meters. It has a gain around 8.7 dbi in
>>four directions. Oriented properly, those four directions will cover
>>most of the land area on this planet.

Jeff, lookie here! Good info!

>>TV twin-lead is not a good choice for this antenna. You need the
>>least lossy feed-line possible. Open-wire feed-line is best but 300

Amen!

>>ohm ladder-line is OK. G5RV antennas and all the variations do not
>>violate the laws of physics. A good antenna program will give you an
>>idea of what the impedence of an antenna is. You can use a Smith

Don't have any of these myself, but wonder what one you consider "good"?

>>Chart to estimate the impedence at the coax/twin-lead junction and
>>then at the end of the coax. It can be extremely high or extremely
>>low but it will not likely be 50 ohms resistive.

I'd say you can count on it NEVER being 50 ohms resistive, Har!

>The length of the shortened G5RV is 51 feet with 17 feet of ladder
>line to match it. I tried doing some calculations as to why 20 and 49
>load up so well. What I cam up with was that the 51 foot G5RV was a
>3/4 wave 20 meter antenna and a 3/8 wave 40 meter antenna. Strangely
>enough the antenna is 1 1/2 waves on 10 meters but doesn't seem to work
>all that well. This discussion got me to wondering what makes a antenna
>a good radiator outside of the height and ground effectsi? If height and
>ground is all that it took then a dummy load at 10000 feet would work great!
> Jeff Jones AB6MB

>>The 29.5 MHz feed-point impedence at the center of the antenna is
>>around 100+j10 which gives a 3/1 SWR on the 300 ohm line. Assuming a
>>.82 velocity factor in the 300 ohm line, the transformed impedence at
>>the end of 17' will be around 500+j400, a terrible match for 50 ohm
>>coax. SWR will be 18/1 in the coax so you will lose half your power
>>for every 50' of coax. A 1/1 balun won't change things... a 4/1
>>balun will give a better match on 10 meters but possibly a worse
>>match on some of the other bands.

The impedance is a bit higher than I thought, but look at all that
reactance! No wonder it doesn't do to well on 10 Jeff!

>>I learned all this the hard way and took time to understand the
>>theory afterward. I now run a 105' center-fed with 300 ohm
>>ladder-line directly into a balanced antenna tuner and it works
>>great. These antennas are usually non-resonant at the frequencies of
>>operation and have a very high SWR. A very high SWR is of no
>>consequence in a lossless transmission line so get as close to
>>lossless as possible. This precludes the use of coax like RG-58.

Amen again! The center-fed zepp is simply the best choice for multiband
operation. No problem here if you happen to want to use it on 30 for
example, vis-a-vis the G5RV! I used one just as you described for 20
years, and am about to put up another. Down comes the G5RV. And the
main reason is I'd like to do some 30 meter QRP, and right now I don't
have an antenna that'll do it. If I still had the zepp up, it'd be
sit down and do'er. I do make my zepp 130' long as I like the CW end
of 75.

>>73, KG7BK, CECIL_A_MOORE@ccm.hf.intel.com at Internet_Gateway

>If your antenna is only 51 feet long total, then its not a G5RV.
>Rather, its an adaptation of the original design by someone else.
>73, Paul

>>Paul, AntennasWest publishes a 36 page $7 TechNote #124d on G5RV
>>antennas. In Table 2, they have "G5RV TYPE, Leg Length: Double Size
>>= 102', Full Size = 51.3', Half Size = 25.9', Quarter Size = 13.3'".
>>They have assumed there are different "types" and "sizes" of G5RV
>>antennas. I have an article written by G5RV, himself, that says it
>>is best not to use any coax on a G5RV antenna. The term "G5RV
>>Antenna" now seems to represent a whole family of variations. 73,
>>Cecil, KG7BK

OK, on the "whole family of variations"! I had no idea to tell you the truth and tend to think of the G5RV as 102' with the feedpoint in the center thru the famous (or is it infamous?) Q-section. Thats what I tend to think of as the "traditional" version. The shortened versions must be pretty recent adaptations of the theme.

>less than desireable for backpacking and portable battery-powered
>operation. I've been misinformed on other things before, though,
>so you might want to check this out for yourself before taking my
>second-hand word on it.

> -joe

Geez! Mine doesn't draw anywhere near "2 amps on receive"! More
like .2 maybe (200 milli-amps). Two amps at 12.5 volts would be
25 watts! Somethings gotta be wrong! Was the radio hot with the
little fan running perhaps? I recently ran the radio at 50W
on battery power in Field Day. My battery is a 20amp hour motor-
cycle battery made by Panasonic; lead acid, but of the sealed
variety. I completed almost 200 Q's on CW, 40 meters and never did
have to re-charge the dude! (Note that re-charging from the "mains"
is not permitted during the Field Day period!)

I have set my back-light setting down to mid-range, but I wouldn't
think that in itself would make that much difference. It might
draw an amp or so at full audio volume, I haven't checked it. I
will and post a note with what I find.

Yes, Danny has moved! Here is his new address for anyone that want's it;

DAN'S SMALL PARTS AND KITS
1935 S. 3RD W. #1
MISSOULA, MT. 59801
PHONE/FAX 1-406-543-2872

Also should mention that he is carrying some kits now, such as the following,

40 meter Cubic Incher $12.50
Two-Fer Transmiter $22.50
Neophyte Receiver $22.95
20 meter Superhet transceiver $49.95, From Jan. QRP Quarterly, anyone have
any info on this?
Little Joe Transmiter $17.50 without crystal
QRP crystals,14060, 3560,7040,7110,10.106 $5.00 each!

Shipping $3.75 per order, make check payable to Danny Stevig.

Don't work for him just a satisfied customer!

One of my pastimes (asides from starting flamewars) is sending
CW with the Vibroplex to the KAM. It takes quite a bit of practice
to get your fist solid enough to get the text on the screen to
match what you *thought* you sent.

Using a bug is an art. Adjusting it correctly takes patience.

And I do have a friend (he's responsible for my getting licensed)
who purposely sends poorly. "It keeps me from having to talk to
'codeless CB types' and thier KAMs." But he's a bit too rabid about
recent changes in our hobby.

From: smansfie@arrl.org
Message-ID: <1732@arrl.org>
Source record: 279131

Fellow hams:

I guess we haven't done a good enough PR job on our PR!

Amateur Radio is getting its fair share of publicity (and more). I have mailed Robert Penrod (callsign?) a stack of clippings roughly 2 inches thick culled from papers around the country in the last few months. That's just a sample. I invite him to analyze them and report his findings here.

Last year, we (with the help of our PR firm) placed major stories on "CBS This Morning," "ABC Nightline", "NBC Overnight," AP Radio, ABC Radio and CNN.

In addition, we placed stories in nearly all major metro dailies, including the Chicago Tribune, the LA Times, the San Diego Union, the Detroit News, New York Newsday, the Miami Herald and the New York Daily News.

How about national newspapers? Well, we placed stories in the Wall Street Journal, USA Today and the New York Times. What's left?

Except for a few major stories (i.e. hams in Hurricane Andrew) Amateur Radio is a local story, as far as the news media is concerned.

More important, news is what reporters and editors say it is, NOT what WE say it is. So, we have developed a network of nearly a thousand local hams, at least half of whom are professionally employed by the media, to place Amateur Radio stories in their local papers and broadcast stations. It's working, and it's the key to our success.

But no matter how much good publicity we achieve, it won't do much good if the Amateur Radio community itself is not open and receptive to a public that doesn't know much about radio and has no incentive to learn.

So, whether or not you think we're doing a good job, I urge you to pitch in and help with your local Public Information Coordinator or Public Information Officer. E-mail me for his or her name and address. I'll put you in touch.

I want to buy an old British motorbike so I've GOT to sell these things.

==========

C90 90cc motorcycle, D reg, 11000 miles, gold colour, tax & MOT for 11 months,
100 mpg, top box and windscreen, electric start and fuel gauge. Real luxury.
Ideal for commuting in any weather.

Costs 1400 pounds new.

A bargain at only 295 pounds ONO

==========

C90 90cc motorcycle, X reg, 9000 miles, red colour, MOT for 12 months,
100 mpg, top box and windscreen.

Another bargain at 230 pounds ONO

==========

C50 50cc motorcycle, V reg, 7000 miles, red colour, MOT for 12 months, 150 mpg.

Ideal for a learner or for commuting.

Even more of a bargain at 125 pounds ONO

==========

Ham radio FT707 HF tranceiver, 100 watts output complete with 20 amp power
supply. Good condition, recently serviced and realigned.

Has to go so only 325 pounds ONO

==========

Ham radio FT207R VHF 2 metres, 10 watts output and fitted with scanner.

Surplus to requirements so only 125 pounds ONO

==========

Ham radio aerial tower, 50 foot, telescopic, tiltover lattice fitted with
rotator bearing and complete with ground post.

Has to be the snip of the century at only 325 pounds ONO

==========

Has anyone any information on decoding CW on a PC?
I'm aware of the Soundblaster system but I want to use a
laptop so that means serial or printer port connection only.

Any schematics for a pre-filter/PLL scheme? Does it work under
less than perfect conditions and with T5 notes? OK, I know
that nothing beats the ear at pulling it out of the noise.
Any DSP system like the W9GR ?

What is the best software for decoding?

All information gratefully received!

REALISTIC CTR-85 MOD WANTED

Do you know how to modify the Radio Shack Realistic model CTR-85
Voice actuated cassette tape recorder (Catalog # 14-1056)?

As supplied from the factory the unit -- while in voice actuated
mode -- continues to record for a few seconds even once the
noise has stopped. This is a feature that prevents the recorder
from shutting down between normal pauses in conversations.

This continuation is longer than I would like since it produces
"blank" wasted tape, thus shortening the amount of scanner
output that can be recorded. It also makes play-back time take
much longer.

I have the schematic diagram if any of you ``enginnering-types''
would like to take a look. I can send it 1st class mail or FAX
and you could mark-up the copy and return it to me.

If you have the MOD -- please post. If you want to see the
schematic please send me e-mail.

Regards,

Kevin

|> I don't usually care much for computer sent CW. I find that many op's
|> using computer keyboards spell out every word and tend to send long
|> monologs that give me writers cramp.

is this due to length of time of operator possessing a ticket? i'd think
that a newbie would be worse about this than an OF. for slow speeds i
abrv as mch as possble so we wont hv lng qso. ;-) at higher speeds i
find most ops will reduce number of abbreviations. think this is a side
effect to 'kinda of lower the number of random groups'. random letters,
which if you think about it is exactly what abbreviations turn out to be,
are more difficult at higher speeds above 40 wpm or more.

But for the ultimate in calls you need to be a monarch. 1 + 2 or 2+1 calls are "obviously" a lot better but nothing beats a 2+0 call, like King Hussain, JY1. Shame its two long letters. King Juan Carlos of Spain has a EA 2+ 2 call perhaps he could finagle a 2+ 0 like EA5 or even EE5. Just think of the problems in pile ups: "The Juliet Yankee One station, your full call please".

A short while ago I met a ham on 2m FM with the call KB7QQQ -- enough to keep you from using CW at all!

I'm still debating whether I should change my call (it is an nice CW call -- it has good rythmn). I could imagine getting AB7CJ or CY or something -- oh, that looks ugly.

But in 20 years all of these calls we have will seem like valuable old calls. And you'll be able to say "I remember when we had 1 + 3 calls and people dropped them like crazy to get 2 + 2's -- a bit shorter than todays 2+ 4 calls, eh, young 'un? <drools on shoulder, and rants about how real hams in the old days used to use TCP/IP over AX25 at 1200 baud and none of these new-fangled multimedia networking protocols at 100Mbps>"

Kevin Purcell N7WIM / G8UDP (2 x 1+3 -- so there!)

4960. rsgb gb2rs news 18th july

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 17:01:41 UTC
From: ted@tedb.demon.co.uk
Message-ID: <742755701snz@tedb.demon.co.uk>
Source record: 279042
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur,rec.radio.info

Good morning. It's Sunday the 18th of July and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The RSGB Woburn Rally is today; another Wireless Telegraphy Act prosecution has concluded; and a there's a new venue for the Torbay Rally.

The Radio Society of Great Britain National Mobile Rally takes place today Sunday the 18th of July at Woburn Park, near the famous Abbey in Bedfordshire. It is easily accessible: leave the M1 via junction 13, whether arriving from the North or South and not 12 as signposted, and follow the signposts to Woburn Abbey. Watch out for the RSGB signs. Do not follow the signs to the Game Reserve or the Wild Animal Kingdom. The rally features a large trade exhibition, an RSGB Bookstall and enquiries stand, a BARTG stall and a members mart area, all under cover. All the normal Woburn attractions will be available at a small extra charge. Doors open at 10.00am and refreshments are available nearby. July Radcom page 41 gives full details and a map of the surrounding area.

In a West Midlands court on the 8th of July, David John Giles-Probert was granted a Conditional Discharge for three years on three charges relating to the Wireless Telegraphy Act 1949. Dudley Magistrates ordered him to pay DTI costs of 1000 and to forfeit some of his radio and test equipment.

Due to unforeseen circumstances the venue for the Torbay Mobile Rally, scheduled for Sunday the 29th of August, is not as advertised. The new venue is the Audley Park School, Barton Road, Torbay. Further details from G3HTX on 0803 526762.

The 70 Centimetre Voice Repeater GB3AN is currently off the air and will be out of service for about three weeks. This is to carry out a change of site, to Nebo, near Amlwch on the north east coast of Anglesey, and a channel change to RB8. The Arfon Repeater Group apologises for any inconvenience caused and will keep users informed of developments via GB2RS and via packet messages posted on GB7ABB. For further information contact the repeater keeper GW4KAZ whose address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Bahamas, KD4GLC will sign KD4GLC/C6A from now until Monday the 26th of July mainly CW on the five bands 80 - 10m and possibly some 30m. From Aaland Islands, DK7ZB will sign OH0/DK7ZB from Friday the 25th of July until the 20th of August on all bands 6 - 160 metres, CW only. From Tanzania, G0GWA will be active as 5H3FOE from now for three months, mainly on CW. From Montserrat, a YL group, including N6XJM, KM6WF and AB6MP will sign VP2M/own-call from Sunday the 25th to Friday the

30th of July. Operation mainly SSB with some CW and RTTY, check 3900, 14250, 21350 and 28,350kHz.

We know of only one rally for today Sunday the 18th, which is the RSGB National Rally at Woburn mentioned earlier in this bulletin.

We have been notified of five rallies taking place on Sunday the 25th of July:

The Colchester Radio & Computing Rally is to be held at the St Helena School, Sheepen Road, Colchester, which is located adjacent to the Colchester inner by-pass, Avenue of Remembrance. The venue is signposted from the A12. Doors open at 10am and there is easy access for wheelchairs and ample car parking space. There will be trade stands catering for radio and computer needs as well as components suppliers. The event also features an amateur radio car boot sale and a bring & buy stall. Morse test will be available on demand, but remember to bring two passport-type photographs. Talk-in will be on channel S22. Details from Frank, G3FIJ on 0206 851189.

Also next Sunday, the 25th, the Norfolk Amateur Radio Club and Hewett School Radio and Electronics Group Rally takes place. Doors open at 10.00am. There are trade stands and a bring & buy stall also various displays stands. The venue is described as suitable for all the family. Details from Sheila, G0KWP on 0603 618810.

The East Yorkshire Radio Rally is to be held next Sunday at the Beverley Racecourse, North Humberside. Doors open at 11.00am, or 10.45 for disabled visitors. There will be trade and special interest group stands and a bring and buy stall. Events start at 12 noon with Morse tests available on demand, but remember the two passport-type photos. At 2pm the East Yorks Repeater Group will give a lecture, an RSGB RLO meeting takes place at three, and at four there is an RSGB questions and answers session. Further details from Peter, G4EJP on 0964 550397 evenings or 550921 during working hours.

The Radio Amateurs Invalid and Blind Club's Annual Romsey Picnic is held on the 25th at the Broadlands, Romsey, Hampshire. The event features the usual attractions, plus a junk sale, a bring & buy stall, refreshments and a grand draw. All members, families, friends and supporters are welcome. Talk-in will be on channel S22. Any contributions for the junk sale and offers of prizes for the draw will be greatly appreciated. Further information from John, G4COM on 0703 693017.

The Rugby Amateur Transmitting Society fifth Annual Rugby Radio Rally is to be held at the BP Truckstop on the A5, some 2 miles North from junction 18 of the M1 motorway. Trader and visitors welcome from 8.00am. The truckstop will be open for catering and other facilities throughout the day. Talk-in will be on channel S22 by GB5RRR. Details Peter, G0JEW on 0455 552449.

HF contest news now:

The RSGB Low Power Field Day Contest is taking place today Sunday the 18th of July, from 0900 to 1200GMT and 1300 to 1600GMT. This is CW only on 3510 to 3560kHz and 7010 to 7040kHz. See July RadCom page 81 for the power output categories and equipment special conditions The first ever Islands on the Air

SSB Contest runs next weekend from 1200GMT on Saturday the 24th for 24 hours on 3.5 to 28MHz. See March RadCom page 81 for full details.

VHF contest news:

The RSGB 144MHz Low Power Contest is on Saturday the 24th from 1400 to 2200GMT. It features four entry sections: single operator fixed, single operator portable, all others and short wave listener. The RSGB 432MHz Low Power Contest will take place on Sunday the 25th of July from 0800 to 1400GMT. February RadCom on page 66 has further details of both of these events.

News now of a special event station operating this week:

Starting on Tuesday the 20th until Saturday the 31st of July the callsign GB4ATC will be aired from the Royal Tournament at Earls Court, London. The HF and VHF stations will operate daily from 1000 to 2100GMT.

And now the solar factual data

The period from the 5th of July to the 11th saw the quiet side of the sun looking our way. There was only one flare, a small B4.2 on the 11th. All parameters have declined, including HF band conditions. Sun spots meaned about 66 with numbers dropping every day. The solar flux also declined, dropping from 101 units on the 5th down to 83 by the 11th, with the period averaging 91 units. The geomagnetic activity started at quiet levels, but from the 8th increased up to very unsettled and reached sub-storm levels of 22 units on the 11th. The period averaged 13.6 units. The state has been 'nil, nothing to report' throughout the period. The radio quality indices declined to well below normal and had not recovered by the 11th. The Fort Collins Boulder, Tokyo, and Canberra circuits were extremely poor. The aa indices daily averages, as supplied by the British Geological Survey for the period 29th June to 5th July, averaged 26.2 nanoTeslas. The 1st and 2nd being unsettled up to periods of 80 nanoTeslas, with the 5th being quiet down to periods of 5 nanoteslas. The X-ray flux has also declined, dropping from B2.0 to A5.7 by the 11th. The period averaged B1.4.

Now the ionospheric data for Central France:

The F2 day-time critical frequencies at Poitiers as reported by Meudon averaged 7.1MHz and the darkness hour lows averaged 4.7MHz. There were many periods of blanketing E almost every day lasting up to 12 hours on some days.

Now the ionospheric data for the north:

The F2 day-time critical frequencies at Ekaterinberg averaged 6.1MHz and the darkness hour lows 3.5MHz. Levels have been depressed as the magnetic disturbances have been in the high latitudes. June saw the finest period of sporadic E that most of us can remember. It was reported on 50MHz every day except for the 23rd, with many openings to North America. The August edition of RadCom, which will be posted to all RSGB members in just over a week, deals with this in some detail.

And lastly the solar forecast:

The sun is now showing a small active region of about one quarter with three quarters mostly quiet. This week will still see a relatively quiet part of the sun looking our way. Solar flux levels are expected to be about 100. Geomagnetic levels are expected to be unsettled. The radio quality indices are expected to be normal improving later in the week to well above normal.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T W and G7 O X series, and Novice calls in the 2 0 A F and 2 1 B Z series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

4961. UHF Contest Activity

Newsgroup: rec.radio.amateur.misc

>Have any of you attempted converting existing 49 mhz walkie-talkies,
>cordless phones, etc. to 6-meters? I have an urge to give 6-meters

Awhile back someone posted the results of such an attempt. They
were using a set of baby monitors. In the case of the baby monitors,
all that was required was to replace the crystal. Bob Parness (I
think) later posted some instructions on how to convert baby monitors
to 6-meters.

4965. Teletype question

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 17:26:08 UTC
From: jka@ece.cmu.edu
Message-ID: <CA7sDA.A4K@fs7.ece.cmu.edu>
Source record: 279092

I recently became the proud owner of a real honest-to-god
Teletype(TM). Two questions:

1. The ribbon is pretty dry. Is there some way to re-ink it? Do I
have a prayer of finding Teletype ribbons.

2. How do I get this monster to talk to my modem or TNC (electricly,
that is). It has an RS-232 (DB25) connector, but my friend tells
me that these things use current-loop (?) instead of voltage-level
signals. Anyone know what he's talking about?

Thanks a lot for any help.

- Jay, KE3AT

4966. Re: What does it take to fry RG-223

Source record: 279129

Yesterday, I posted:

: "Reference Data for Radio Engineers" has a chart of max power ratings
: of various RG cables in the 10-3000MHz range. RG-58, which will have

etc.

Well, rather than this single datapoint, you can note the following, which should be fine for ham work in the 1.8 - 1000 MHz range: For all coax cables, the thermally-limited power rating will go down with the square root of frequency. So the 10MHz rating will be 3.16X the 100MHz rating and 10X the 1000MHz rating. (Note that loss in dB/ unit length goes UP with the square root of frequency, too, in this range, for practical cables used by hams) Given that info, you just need a few data points: using the same fairly conservative constraints as my posting yesterday, that is 40C ambient, 80C max inner conductor temp, but 1:1 SWR and continuous CW power, here are the max powers _at_10MHz_ for a few common cables, from the same reference:

RG-58 550W
RG-59 900W
RG-6 1.3kW
RG-11; RG-8; RG-213; RG-214 2.1kW

Correct for frequency as noted above. Check for max voltage as well, particularly at lower frequencies, higher impedances, and high SWR.

To correct for SWR, multiply power delivered from the transmitter by the SWR, for use in the thermal limit. For voltage limits, see Gary C's discussion. You can fudge on the power rating more than on the voltage rating: if the cable arcs over and makes a carbon track, it's gone. If you are running CW or SSB-PEP, the _average_ power is likely well below the peak power. But if you are running something like RTTY or FM, take the power rating seriously. (Scott D. didn't note if his 1kW at 28MHz was average or peak...)

BTW, if you can lay your hands on Teflon-insulated coax, the power ratings for similar sizes to the above are around 10 times as high, though the losses are only slightly better.

```

the transceiver in the january 1993 QQ looked very good, at least as shown in the photographs and in the schematics. i'd think the $49.95 price, assumming this is components and boards without case and associated hardware such as jacks, PL-259, etc. is very reasonable. the rig is qsk without relay and uses 2SC799 as final, so it'll do ok on power out, say 3 or so watts. the article used two boards. does Danny's kit?

i was looking at the article last night. the receiver and transmitter looked at lot like the new MXM rig which Bruce Williams, WA6IVC has been working on the during the last year.

i'll fax to Danny and get more details and bring the article tomorrow in QQ for details. thanks Jeff for the note on Danny. knew that he was moving etc. but hadn't heard anymore. wonder if he'll be able to get rf outta the valley there. nice quite place, in fact wouldn't mind living there myself, but i'll be the winters are hell on wheels. ;-)

from the warm south,

dit dit

: R.F. stages.
: Bruce KD6OTD

As a DJ-580 owner with a radio that probably was made just before the
(rumored??) factory changes to reduce intermod, I've been following this
discussion with interest. It has occured to me that for base-station ham
use, at least, and maybe even for mobile ham use, you could put a good
passband filter in the antenna lead. A three or four pole helical
resonator could drop stuff outside the ham bands by more than the
antenna gain pretty easily, I think. Dunno quite how you'd do it for
146 and 440 MHz at the same time, tho, if your antenna is dual band.
Has anyone else thought about doing this?

Many years ago, in a former life, I worked as a temporary over the Christmas holiday at RS. I thought it would be neat to sell parts, etc. to people who shared a common interest in electronics.

After starting and sitting through some of their sales tapes, I discovered that the system is biased against sales types that focus on parts. RS sales people who really try to help people and sell them parts, end up making minimum wage and then being leaned on by the manager for not selling enough $$$. What they really want to have sales people do is sell stereos and computers. That is how good RS sales people make money and get promoted to manager.

In the stores I was in, hobbiests were normally left alone as soon as they were identified as such. Only a few of us who were hams would even talk to them. The sales rep.'s view is "I have to sell $71 per hour to make my manager happy ($71/hr * 6% commission = $4.25 [minimum wage]) so why should I spend 15 to 30 minutes helping some guy who will only buy $2 worth of parts?

Just a small glimpse into the world of RS sales from a former/reformed employee.

Apparently when he moves he does not have his mail forwarded (Hmmmm... ???)

Just after his last move I sent him a letter requesting his latest price list
and never got it. That is when I found out that he had moved. Apparently
mail to the old address did not get forwarded.

I have ordered from him twice over the past few years. Good service otherwise.

4974. What does it take to fry coax???

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 18:09:33 UTC
From: ham@wam.umd.edu
Message-ID: <2246gt$psv@cville-srv.wam.umd.edu>
Source record: 279134

Honestly, all you need to do is the following:

Heat pan to about 350 degrees, using medium heat and vegetable oil.
Cut up the coax into 6 inch long segments, and toss into fry pan.
Turn frequently until outer insulation is tender.

Reduce heat to a simmer, and cover. Continue to cook 1 minute for
each 1/4 inch thickness of cable.

Twinaxial cable takes approximately the same time, while double-shielded
cable may take 50 percent longer.

The above directions are for solid center conductor, with foam insulation
and braided shielding. Other insulations (poly, teflon) will work but
tend to give the coax a very firm texture, as opposed to the tender
texture of foam.

Can be served as a side dish, with butter/margarine or cheese.

I have a Saturn (3 loop) Halo antenna for 6 meters. It is missing whatever matching/balun lashup that matches the antenna to the feedline. Does anyone have information that can help? Please respond here or by EMail to dne@data.hsc.colorado.edu

Thanks & 73

Dave

: space?

No. You can think of an antenna as a transformer that "matches" the
377-ohm free space impedance to whatever impedance your transmission
line is. So long as your transmission line matches the radiation
resistance of the (resonant) antenna, you are not losing anything.

There was an article in NASA Tech Briefs magazine a few years back which described a technique for recharging rechargeable batteries, which said that they also had great success recharging Alkaline primary cells with the technique. (Sorry; I had a photocopy of the article and lost it, and can't find another.) No explosions, and the battery came out of the charge cycle actually with more capacity than it had when brand new. No word on how many times they could recharge one, as I remember.
I've been playing with the technique, and although I haven't had any success with Alkalines (at least the _one_ battery I tried), it actually helps remove shorts and restore useless batteries to moderately useful ones.

To ANYONE even thinking about recharging alkaline cells: Don't, don't, a million times, DON'T!

Every so often, some goon or another will get a patent on a charger, and invariably, when the buyer tries to charge Alkie cells, BOOM!

Back when I was in fifth grade (1984), my dad got his hands on one of these and installed it out in the garage (Good idea). One day, while we were innocently going about our business on the workbench, BLAM! The closes we ever figured was that one cell exploded, causing the others in the charger with it (The 'charger' [read: detonator'] held four cells) to rupture as well.

The walls and ceiling took considerable battery shrapnel damage, the charger was destroyed (Serves it right!), and both my dad and I were sprayed with electrolyte that, quite frankly, burned hotter than hell.

Moral of this story: Alkaline rechargers are marketing's way of weeding out the incredibly gullible, with the working concept being that someone will be close enough to the thing when (not if) it explodes to be hurt/maimed/killed by it.

Don't even THINK of buying this piece, and remember: The label on the Alkie cells that says 'will explode if recharged' means just that!

I've asked this question a couple of years ago on this forum, and never got any answers.

What limits a person's code-copying ability? Is it transducer (ears) or processor (brain)? I've always been curious about this as I hit a brick wall at about 50 wpm, where it begins to sound like so much rtty.

I've always entertained the idea it was in the ears (of course, there's nothing wrong with my brain!), where the limit is reached by the Q of the eardrum. In other words, it "rings" with the incoming wave train and runs one pulse train into another. Maybe I could lower the Q of my eardrums by not cleaning my ears so often.

Seriously, If this is the fact, wouldn't it be possible to raise copying ability by sending a few cycles of "reverse burst" (sorry, Motorola) to condition the eardrum for the next wave train at the end of the last? If this works, you heard it here first...

4980. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 20:12:59 UTC
From: jfw@ksr.com
Message-ID: <29517@ksr.com>
Source record: 279138
Cross-posted to: sci.electronics,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.info

[$Revision: 2.13 $; last updated July 15, 1993]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations. Note that sending $1 along with catalog requests is a big help for these folks.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog (but note that they are STILL (12-May-93) out of catalogs and it will probably be months before the next one is ready).

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7
(800)-677-8899 (US)
(800)-363-6592 (Canada) [Not listed in current catalog, try US number]
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than

hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Maplin Electronics Ltd.,
P.O. Box 3,
Rayleigh,
Essex,
SS6 8LR
U.K.
Phone numbers: your international code +44 702 554161 for sales
+44 702 553935 Fax
+44 702 556001 Tech enquiries(2-4pmGMT)
"Over here [in the United Kingdom] the main hobbyist electronics supplier is Maplin Electronics who stock a wide variety of equipment. They have a catalogue which can be shipped for 10.65 pounds sterling by air or 5.50 pounds sterling by surface mail. They accept Mastercard, American Express and International Reply Coupons. They have at least one type of air-filled variable capacitor!" (Thanks to Kev White at Cambridge University).

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets. Also note that they have six Canadian offices, and one UK office, and will take international orders at 500 N. Pulaski St., Chicago IL 60624-1019, +1-312-784-5100
(FAX +1-312-638-7652, TLX 6718690 NEWARK U).

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(800) 831-4242
(800) 237-6948 (FAX)
(415) 592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: 800-538-5000
Cust. Service: 800-538-5001
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling.
Wide array of ICs, good assortment of electronic components.

EasyTech Inc *** out of business? ***
2917 Bayview Drive
Fremont CA 94538-9932

(800) 582-4044 (orders) (no longer in service?)
(510) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).
11 May 93: "EasyTech no longer has an 800 number, and has dropped several lines. The last time I called them (2 months ago), I got the impression they were slowly going down the tubes..." - dts@banyan.com "Both of their 800 number and the customer services numbers are disconnected, and no new numbers are given." - lau@gandalf.rutgers.edu

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
(800)325-0101 (US & Canada)
(503) 336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
(800) 645-9212
(516) 349-7620
(516) 349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff, overnight, export (like to Hawaii :-), and etchant; based on UPS charges). Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
(800) 848-8001 (Orders)
(215) 788-5583
(215) 788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30; Most items are new overstocks, much regularly stocked stuff as well. Tools, electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
(408) 943-9773
(408) 943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
P.O. Box 48838
Niles IL 60714-0838 ### New address.
(708) 475-8440
(708) 864-1589 FAX
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras, velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains, you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping (extra for Alaska & Hawaii). Surplus electronics, pretty random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464
No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
(800) 4-HALTED Orders only
(408) 732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10 ($2 handling charge under $20), plus UPS shipping cost. Has three stores, of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog.

Local store, a cleveland institution, is called Electronic Surplus, Inc., and has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1502 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
(402) 346-2939 (FAX)
New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but all well used). Prices seem relatively high, and you'll be shocked to learn how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and they certify the used equipment to meet the original specification and warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
1-800-235-6222 (Ex. CA)
1-818-787-3334 (CA)
1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
(213) 763-5770
(213) 763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
(619) 747-3343
Toroid cores and shielding beads.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]
13980 NW 58th Court
P.O. Box 4650
Miami Lakes, FL 33014-0650
(305) 557-8222 Order department
(305) 557-7955 Customer Service (ask for Mirta)
(305) 558-1255 Catalog (ask for Elizabeth)
(305) 557-8004 Custom-made Parts (ask for Ziggy)
(305) 557-8005 Non-standard Sizes
of catalog parts (ask for Eric)
(800) 423-9009 Toll free FAX line
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets, tools, wire-size drill bits (as in #61 size for PC board holes).

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously supplied by Ed Hare and Mike Gruber at the ARRL.)

624 Kits
171 Springlake Drive
Spartanburg SC 29302
QRP kits (including some designs from W1FB's books) and some parts.

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz postage).

Message-ID: <1993Jul15.204515.21171@kpc.com>
Source record: 279147

Speaking of the contest. What is the date for the contest. Since I live
in San Jose California what is my IRAU region 6, 7, or 8. I looked up the
April QST and it said the contest was July 10th in which case this question
is moot.
Thanks in advance.
Nat.

got the June QST handy. from the ads:

Microcraft Corporation the Code Scanner $189 and Code Start $139-kit $179-
wired each rates 3-70 wpm automatic speed tracking

Kantronics KAM Plus (no specs no price one ad - Radio Center)
KAM ($289 for all mode TNC - Texas Towers)

and it seems to be there may others in other issues that have systems
for receiving CW.

all owners of same. send me email. how good do you find them to
be? adjustable bandpass? do you use DSP with the critter? i won't
tell i promise.

i'd guess that during FD and SS, they are useless at any speed. :-)
it's hard enough just for a human being!

it'd be interesting to have a standard test set of conditions to compare
how each operates with QRM and QRN combinations and how well a human
being does. say at 30wpm?

i like Jeff's idea of sending to one to get his spacing, etc. correct.
might become a requirement before getting on the air! how about a
driving test every two years or so?

:-)

73 de k5fo dit dit

p.s. i do not claim to know a lot about cw. i just use it. call me an appliance operator for the mode. i do build my own equipment.

4983. Teletype question

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 20:51:42 UTC
From: jka@mustang.ece.cmu.edu
Message-ID: <JKA.93Jul15205142@mustang.ece.cmu.edu>
Source record: 279162

I recently became the proud owner of a real honest-to-god
Teletype(TM). Two questions:

1. The ribbon is pretty dry. Is there some way to re-ink it? Do I
have a prayer of finding Teletype ribbons.

2. How do I get this monster to talk to my modem or TNC (electricly,
that is). It has an RS-232 (DB25) connector, but my friend tells
me that these things use current-loop (?) instead of voltage-level
signals. Anyone know what he's talking about?

Thanks a lot for any help.

- Jay, KE3AT

Source record: 279146

Last year I took some video of our club's field day activities. As I was editing and piecing it together, I got the idea of putting some music behind it... so I got up with my midi setup and did a little song... with CQ CQ CQ FD FD FD... etc. as the melody. I showed it to one of the guys in the club who had just gotten his extra, and he missed it completely. After I told him about it and had him listen to it again, he said he could hear it, but would NEVER have gotten it if I hadn't told him about it... so he made a friendly bet with me that when I showed it to the club, NOBODY would catch the code in the song.

Well, I thought he had won, but after the meeting while we were having our cookies and coke, one CW afficianado (W6RFF - Jettie Hill, our ARRL section manager) came up to me and asked me "How did you get the code into the song", and "Why didn't you work my call into it?" (We had used his call at Field Day). So I dragged him over to the other fellow and asked him to ask the same question... and then I got paid! :-)

4985. Intermod Analysis s/w ???

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 21:02:44 UTC
From: andres@scf16.scf.loral.com
Message-ID: <1993Jul15.210244.29732@scf.loral.com>
Source record: 279150

Rec.radio.???

Newsgroup readers - I am after the formula, which will be translated into software which can tell me if two RF frequencies have intermod analysis problems.

Why? On a project in which I am working we have an electronically tunable transceiver, within a 6 Mhz channel, 500-612 and 612-800. Given that I can give the radio a starting pt, we had a consultant who said that we could use 7 frequencies within the 6 Mhz television channel without having intermod analysis problems. According to the consultant, one the 8th was chosen, it would have resulted in intermod problems.

Not being the radio type, I am grateful for any help in this area. I'd prefer email direct to jandres@scf16.scf.loral.com.

Thanks.

|> donrm@sr.hp.com
|>
|>

limit is probably the ear(s). i'm 6'6" tall and have been since i was
in the eighth grade. went i went to doctors for checkups, the first thing
they check is your ears. EVERY doctor i went to said, "My, what small
ear canals you have". i can still hear sonic motion detectors sometimes
in some shops. i know that i used to have an exceptional upper freq limit.
used to bug the ear doctors when they'd put the earphones on me and run
the frequency up and down.

i do not listen to music, tv, or listen to cw at high volumes. maybe
paranoid or just too sensitive. walked out of a Kiss Concert one time, 1971?
i was 3/4 of the way back from the stage in a large coliseum and after
5 minutes i was in pain. took me two days for my ears to quit ringing. :-)
i, seriously, could not hear anything for three hours.

Don, i'd guess you'd want the Q to be high, otherwise your sensitivity would
be low and it would take a higher volume to drive the eardrum and get it
to move sooner. how can you control the phasing of audio in mono?

i posted this once before and i'm sure that everybody in the world thought
i was/am crazy. take a small point source, say cheap earphone. you know
the kind that you stick in your ear. put it two feet away in front of me.
output steady tone. when the earphone is DIRECTLY in front of me, i.e.
equal angle to both ears, the tone disappears. there seems to be a 180

degree phasing (problem) between my right and left ear.

i don't mind cranking the tone up to 1,000 Hz to listen to cw. note that it bugs a lot of people who consider it too high.

someone else asked about age on speed. well, i don't think it's that critical as in athletics. most of the high speed critters are OFs and i think it's just practice. when you get old, you don't have anything else to do. :-) speed is proportional to the number of hours listening?

i've got to collect all this stuff and write a book..... :-)

thanks for listening to my ramblings, 73 de k5fo dit dit

N9VV, where are you? HELLLPPPPPPP..... they think i'm crazy. :-)

4988. part number needed for Motorola service manual

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 21:16:52 UTC
From: chinatti@phoenix.Princeton.EDU
Message-ID: <1993Jul15.211652.4660@Princeton.EDU>
Source record: 279157

Does anyone have the part number for the service manual for a Motorola Radius 16ch VHF-Hi mobile radio (with the optional signalling logic board)? Probably best to e-mail me- I don't think this is generally that interesting... Also, if anyone has one that they wouldn't mind getting rid of, let me know.

Thanks,
Steve

4990. Alinco DJ-580 Intermod Reduction

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-15 21:24:01 UTC
From: bruce@mongo.Com
Message-ID: <1993Jul15.212401.18797@pixar.com>
Source record: 279153

I got my HT back from Alinco today, after having sent it requesting that they modify it to reduce intermod. They turned it around in a week. This message was on the shipping invoice:

BRUCE, WE HAVE REPLACED THE R419 AND THE R472 AND PERFORMED
A GENERAL CHECK ON YOUR UNIT. WE APOLOGIZE FOR ANY INCONVENIENCE!
IF YOU HAVE ANY QUESTIONS, PLEASE DO NOT HESITATE TO CONTACT US.
THANK YOU. ALINCO ELECTRONICS USA.

So they do more than tweak a potentiometer. I'm assuming these two resistors set the gain of amplifiers in the R.F. or first I.F. stages. I left my schematic and battery pack at home, so you'll have to wait another day to hear how the performance has changed.

NO! wait! before you kill the thread!

This anti antenna business...you're talking about towers with beams?

Or does it include simple pole like ants...like ...oh..Antron 10 mtrs?

I wonder if a SINGLE dark colour wire run from house , out to a tree, like
for 80 mtrs or like for SWL uses.....just a wire...no bright white baluns
nor 1/2 thick coax....

Somthing like that, would be reason to drop a rock on someone?
====
IF thats the case, then they dont NEED us ! (well thats my 1st reaction)

I would tho like to know just how far 'they' go in i.d. ing somthing as an
antenna.

And, can we compare notes on 'low visabilty antennas' , rather than get
each other burning on this issue?

Oh...count me in on joining forces....what do I do?

> Do you know how to modify the Radio Shack Realistic model CTR-85
> Voice actuated cassette tape recorder (Catalog # 14-1056)?

I NOW HAVE THE MOD...

My thanks to Bob Parnass of AT&T Bell Labs for sending me the mods.

His message suggested two:

1) Solder a 1 K ohm resistor in parallel with ``R33'', wich is a 27 K ohm resistor. This will give a VOX hang time of about one second.

--- OR ---

2) Put a 10K ohm resitior across C23 (100uf).

Varying the value of the resistor will change the hang time.

I have not tried the MOD yet but I am sure it will work.

THANKS AGAIN BOB !

Regards,

Kevin

>
> Roughly speaking, what's the effective transmit range
> of those little Handheld Transceivers (2 Watt/ 2 Meter)
> in miles (under optimal conditions?)

I've talked twice to hams on Mt. Lassen who were talking on 2 meter handhelds as they hiked down the mountain via the 147.060 repeater on Mt. Diablo (200+ miles). The range is really determined by line of sight conditions. Working repeaters or other hams that are at a higher elevation is easy on 1 to 5 watts and the range can be, as in the above case, 200 plus miles. Then again, in downtown areas, less then 1 mile at times. Hope this helps!

From: elesatz@du.edu
Message-ID: <CA8J8p.754@du.edu>
Source record: 279168

>Amateur radio needs to mount an effective public relations campaign. Local
>news stories on how hams helped during an emergency are good, but not good
>enough on a national scale. How about a segment on Good Morning America or
>CBS This Morning? Or, a segment on 20/20 or 60 Minutes on how effective
>ham radio has been during the Heartland Floods? This is real public
>relations.

I found it interesting this winter how the news went on and on about
some skiers that were lost in Aspen. It was the top story for at least
3 days.

A couple weeks later I saw a story about some people who became
trapped and "used a ham radio to call for help". A rescue team was
sent in and there were no problems. This episode drew no more
attention than a 15 second spot and I never heard anything else about
it.

This seems to be the general attitude. If a ham operator happens to
save the day nobody is really interested. What makes news is the
tragadies.

From: tedwards@eng.umd.edu
Message-ID: <2255eeINNshv@mojo.eng.umd.edu>
Source record: 279161

I am curious what kind of results people have had with the "handi-finder" from QST a couple of months ago. I have mine basically working, but I haven't been able to do a real fox-hunt style test on it yet.

I wonder if the bow tie arrangement could be changed to increase the amplitude of the apparent audio signal from the oscillator, and to increase the signal received by the antenna, because weak signals don't appear to be easily DF'ed using the system.

4999. Re: How does an American sign in Canada?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 04:02:07 UTC
From: richw@mks.com
Message-ID: <1993Jul16.040207.22599@mks.com>
Source record: 279169

Rich Weinkauf wrote:

Scott, the identification requirements of the agreement state
that you should sign as WY1Z/VE2 ("stroke", "slash", "mobile",
"portable", etc.), . . .

Basically correct. According to section 57 of Canada's "General Radio
Regulations, Part 2", as quoted in circular RIC-25:

57. (1) The operator of an amateur station shall identify that
station, in English or in French, at the beginning and
at the end of each period of exchange of communication
or test transmission, and at intervals of not more than
30 minutes throughout the period of exchange of commu-
nication.

(2) An amateur station licensed in Canada shall be identi-
fied by transmitting the call sign assigned to that
station.

(3) An amateur station licensed by the government of the
United States shall be identified

(a) by transmitting the call sign assigned to that
licensee or to that licensee's station by the Fed-
eral Communications Commission;

(b) if transmitting

(i) by radiotelephony, by adding the word "mobile"
or "portable", and

(ii) by radiotelegraphy, by adding the character
for oblique stroke ("/"); and

(c) by adding the appropriate Canadian amateur call
sign prefix for that geographical location, as
prescribed in Schedule V.

Thus, for instance, before I got my Canadian call, I ID'ed on voice as
"WA6SGA mobile VE3".

The only quibble I have with what Rich Weinkauf wrote is that the
Canadian regulations do not authorize the use of the words "stroke" or
"slash" when working voice.

Also, since an American or Canadian amateur operating in the other coun-
try is required to obey both countries' rules, I would assume such an

operator would need to ID in English (not French, or at least not just
in French), and would need to ID at least once every 10 minutes, not 30.

. . . AND that at least once during each conversation, or every
30 minutes, you must identify your location with the nearest
town, or significant landmark.

No such requirement is mentioned in the material I quoted above. Rich,
can you quote "chapter and verse" on this one?

5001. Dipole antenna construction ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 05:03:53 UTC
From: mohan@tulip
Message-ID: <1993Jul16.000354.4846@uoft02.utoledo.edu>
Source record: 279163

Hello,

I am waiting for the license and wanted to make an antenna for HF operation.

The following have been my basic references:
1. Antenna Here is a Dipole - James W. Healy NJ2L - QST June 1991.
2. Feeding Dipole Antennas - James W. Healy NJ2L - QST July 1991.
3. Connecotrs for (Almost) All Ocassions - Part 2. - David Newkirk WJ1Z
QST May 1991.

The following points are not clear to me.

If I want to construct a center-fed dipole for the 7.1 Mhz band,
the dimension for the dipole is given as 65ft, 11in.
Now, is this the distance between the holes of the insulators at the
support ends (including the length of the middle insulator/spacer), or is it
just the length of the wire not including the middle spacer.

And if I use a TS-520S transceiver and a dipole antenna made as in reference 1,
the transmitter and the antenna will be matched without me having to use
antenna tuners, and what about the SWR ?

Please let me know your opinion rergarding the above.

Thanks a lot for the information.

5002. IC-730 RF Problem

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 06:06:43 UTC
From: thieule@wam.umd.edu
Message-ID: <225ghj$11p@cville-srv.wam.umd.edu>
Source record: 279164

i am currently using an Icom 730 with a Pyramid Power Supply (12-15v @ 25A) and feeding the rig with a random wire thrown out of my bedroom window. The problem that I am having is that on 40m and 20m, i cannot get the rig to put out 100w. The tuner has a built in SWR/Power meter and I can get the SWR below 2:1, but I can't seem to get more than 50w output. Sometimes,however I have been able to crank out all of the 100w. To make matters worse, under some circumstances, I can get a perfect 1:1 match with about 10w output, but when i turn up the juice, the rig immediately turns off when i key the transmitter. I've noticed that the power supply shuts off when i hold down the key.

so now for the question......what's going on??????!?!?!?!?!?

oh, yeah, one more important point....I am 30 ft off the ground and the only ground I use is the DC wall ground and a counterpoise as an artificial RF ground.

any suggestion on how to cure this?!?! I would like to run all of 100w becaus those contesters can get quite impatient with my S1 signal.

I wonder, are these 'fastest human CW-reader' contests done with random characters, or with plain text?
Its generally accepted that, with plain language, satisfactory copy can be obtained if something like 40% of the information is never received; for example the letters 'TH' are almost always followed by 'E', and there are certain groups of letters that always occur together in plain text. (g and h for example).
A true 'fastest human CW-reader' test would be performed using random characters , or, in a language unknown to the reader; anything else is more a test of the receiver's ability to deduce which letter comes next.

As an aside, my mother was trained as a telegraphist at the end of WWII; she could listen to [machine generated] CW in one ear, and type at a mill, while simultaneously holding a phone conversation using the other ear. This really confused some people when she would start reading back the start of a message at the same time as she was copying the end of it...

In article <CA7vtF.2Ez@ms.uky.edu> hgpeach@ms.uky.edu (Harold Peach) writes:

Many years ago, in a former life, I worked as a temporary over the
Christmas holiday at RS. I thought it would be neat to sell parts,
etc. to people who shared a common interest in electronics.

After starting and sitting through some of their sales tapes, I
discovered that the system is biased against sales types that focus
on parts. RS sales people who really try to help people and sell
them parts, end up making minimum wage and then being leaned on by
the manager for not selling enough $$$. What they really want to
have sales people do is sell stereos and computers. That is how
good RS sales people make money and get promoted to manager.

In the stores I was in, hobbiests were normally left alone as soon
as they were identified as such. Only a few of us who were hams
would even talk to them. The sales rep.'s view is "I have to sell
$71 per hour to make my manager happy ($71/hr * 6% commission =
$4.25 [minimum wage]) so why should I spend 15 to 30 minutes helping
some guy who will only buy $2 worth of parts?

Just a small glimpse into the world of RS sales from a former/reformed
employee.

Hmmm.... I work part-time at a local Radio Shack and had much the same
"awakening" as you did. I analyzed my options and elected to work on
my sales techniques. I'm nearly always on commission but will gladly
take a few minutes DURING A SLOW NIGHT to help out the hobbiest types.

Another poster put it quite well when he said that the RS sales persons
are not there to help you, but to sell merchandise. (Cold, hard reality
of life.) Fortunatly, there are many many cases where the customer must
be helped in order to make the sale. For example: Most people don't have
a technical background, nor do they have much technical experience. We
(the staff at the store where I work) take the time to explain the
differences between products and how those differences make one product
better suited to the customers needs than another. That makes for good
customer relations ("He was quite patient and took the time to explain it
all to me and to answer all of my questions.") and it makes good marketing
sense too. We want the customers to walk out the door with a good feeling
that they made the right choice. That's how you build repeat business.

This can sometimes be quite a challenge. We take the customers as they
come, and they come in many different ways..... hearing impared,
intoxicated, preoccupied, technically ignorant, non-english speaking,
belligerant.....

Let me tell you the one about the fella that wanted to know all about
television antennas and installation but had to speak through an inept
interpreter..... Or about the time it took 20 minutes to explain
to one fella how to connect his antenna to his VCR and VCR to television...
Or about the time a customer insisted (against my advice) that a
particular power supply was the one he needed to run his CB radio and
then insisted that I sold him the wrong one when it burned out.....
Or the one that shouted at me when her cellular phone was not back
from the repair center ten days after she'd brought it into the store...

Maybe we could start a "Stupid customer-droid" thread but what would
it prove? Nothing! People come in all different personalities and
intellectual capacities. Some of them are great and some are miserable
but the great majority exist somewhere between the two.

I could just as well tell of the time a customer called my manager to
praise me for helping her make a camcorder decision.... Or of the time
a customer helped me make a sale by explaining to another customer why
he chose that particular model of answering machine.... Or the time I
had to get the manual for a product in order to find the answer to a
customers question and the customer said "I couldn't possibly expect
you to know everything about every product in the store."..... Or
about the person that came to our store rather than two closer stores
because he liked doing business with us.... Or the one that brought
back a product saying it was a good product but realized after getting
it home that it was not suited for his application and that he wanted
to exchange it for the one I said he'd need - this customer waited
until I was done with another customer to apologise for disagreeing.

People - You just gotta love dealing with 'em.

Got to go now.... See you all in a couple of weeks......

>^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Here's what I found out last nite, as promised.

Well, its not 2 amps on receive! Mine draws less than 1 amp, when
first powered up, no signal present, with audio on full! It's not
as low as I thought either, but certainly not 2 amps! It doesn't
even get to a full 1 amp with the backlight lamps on full brightness.
I just thought of a question though that might make some difference,
but with the emphasis on MIGHT. I'm guessing, for sure, but I don't
have the memories fully used up either. Only have about 20 or so
with stuff in 'em. Wonder if that could influence the power draw?
I wouldn't think so, but who knows?

Hi,

I am currently searching for chips, which would decode CTCSS tones from audio signal.

The chip would be used in microprosessor-based repeater controller, so easy interfacing with processors is a plus.

Since these chips seem to be fairly hard to get (at least here in Finland), any pointers will be appreciated.

Thomas Jay Pachner writes:
> Does anyone have any advice or opinions on [heathkit rigs]... ?

In my experience, the performance of most heath rigs
was marginal at best, even when they're working right.
Used ones are often out of alignment or simply broken,
and require service and repairs. The good news is that the
layout is very open and easy to work on, and the manual is
so detailed that you have good chance of fixing it. If you can
get a clean one with its manual, you stand a good chance of
ending up with a simple but usable rig. Don't pay too much: low end
rigs like the HW-100/101 go for around $100 in clean
working order, while later rigs like the SB-102 and 104
go for up to $150-$200. Much more than that, and you can get
rigs like the Yaesu FT-101 or Kenwood TS-520, both of
which are better rigs than most heathkits. Good luck.

Reading over my previous response about heath rigs,
it seems a bit too negative. I've owned one of just about
every rig heath ever made, starting with the DX-20.
I had loads of fun building and using them, but was
always disappointed by their performance. When
compared to commercial rigs, they're just not that
sensitive, selective or stable. Also, most have
few of the features that are now common on modern rigs.
I just didn't want to come across as a Heath-basher.
Cheers...

Mike, N4PDY

From: pacbell.com!well!moon!pixar!mongo!bruce@network.UCSD.EDU
Subject: Alinco DJ-580 Intermod Reduction
To: info-hams@ucsd.edu

I got my HT back from Alinco today, after having sent it requesting that
they modify it to reduce intermod. They turned it around in a week.
This message was on the shipping invoice:

BRUCE, WE HAVE REPLACED THE R419 AND THE R472 AND PERFORMED
A GENERAL CHECK ON YOUR UNIT. WE APOLOGIZE FOR ANY INCONVENIENCE!
IF YOU HAVE ANY QUESTIONS, PLEASE DO NOT HESITATE TO CONTACT US.
THANK YOU. ALINCO ELECTRONICS USA.

So they do more than tweak a potentiometer. I'm assuming these two resistors
set the gain of amplifiers in the R.F. or first I.F. stages. I left my
schematic and battery pack at home, so you'll have to wait another day to
hear how the performance has changed.

Subject: IC-730 RF Problem
To: info-hams@ucsd.edu

i am currently using an Icom 730 with a Pyramid Power Supply (12-15v @ 25A)
and feeding the rig with a random wire thrown out of my bedroom window.
The problem that I am having is that on 40m and 20m, i cannot get the rig
to put out 100w. The tuner has a built in SWR/Power meter and I can get the
SWR below 2:1, but I can't seem to get more than 50w output. Sometimes,however
I have been able to crank out all of the 100w. To make matters worse, under
some circumstances, I can get a perfect 1:1 match with about 10w output, but
when i turn up the juice, the rig immediately turns off when i key the
transmitter. I've noticed that the power supply shuts off when i hold down
the key.

so now for the question......what's going on??????!?!?!?!?!?

oh, yeah, one more important point....I am 30 ft off the ground and the only
ground I use is the DC wall ground and a counterpoise as an artificial RF
ground.

any suggestion on how to cure this?!?! I would like to run all of 100w becaus
those contesters can get quite impatient with my S1 signal.

End of Info-Hams Digest V93 #862

> I'd say go with the dualbander, probably the Alinco DJ-580.

Thanx for the reply. It seems to be a common consensus: Get the
dual-bander. Just out of curiousity, why do you prefer the Alinco?
Why not the Kenwood 78A, or the Yaesu FT-530 or the Standard C528A?

Curtis

In rec.radio.scanner article <CA7wFF.6BK@cbnewsc.cb.att.com>
rats@cbnewsc.cb.att.com (AOR AR-1000) writes:

The Chicago Sun-Times of July 14, 1993 (p. 14) had an article
entitled: "Too Much Static Kills Bid to Ban Scanners" by Fran Spielman.

Ald. Lawrence Bloom (5th) convinced the Police Committee to endorse
a substitute bill (the original bill was going to outlaw scanners
anywhere in Chicago) that will make it illegal to use a scanner to "aid
or abet the performance" of a criminal act after receiving "dozens"
of letters and phone calls from "amateur radio operators" who objected
to the original mobile scanner ban. Stupid, since it is already a
felony. However, it goes along with Bloom's comment about "I happen
to believe that printing [ordinances] is a very honorable profession."

(Comment from Bill Sohl, K2UNK) - Regardless of Alderman Bloom's
political rational, the important point here is that the original
legislation as proposed has been trashed and the new proposed
legislation will in no way affect amateurs or non-amateurs who
have radio equipment in their vehicle as long as they are not
commiting a criminal act.

>Sun eve - was on 6 working Michigan stations when my neighbour
>came over and said that I was audible in two of their phones (they have 7 -
>hopefully not bad news). I stopped operating and went to the books. I have
>a game plan in mind as per the ARRL recommendations but have one primary
>question:
>
>Has anyone found any particular filter or solution particularly helpful for
>6 meter or VHF RFI ? Suggestions are welcome.

I had some trouble with some of my phones and some of my neighbors on 6
and 2 meters. cured it with a large toroid in the phone cord right at the
phone - just unplugged the phone from the wall, wrapped the cord through
the toroid half a dozen times, secured it with ty-wraps, and plugged the
cord back in. toroid selection was that the hole had to be big enough to
get a modular phone plug through. same trick helped on the power cord
of a VCR.

I run several hundred watts on 6 and 2, and
the toroids cured all but the cordless phone, with its 49 MHz receiver.
I convinced her that a reasonable compromise was not to use the cordless
phone when 6 meters was open!

>I am also getting into their FM baby monitor (it operates at 49.99 Mhz)
>but I am less hopeul of solving that one due to its probable WIDE Front
>end - but will try.

HOPELESS! you might try hinting about what they are broadcasting to the
neighborhood...

>My ground is about 3 meters from the rig (as close as I can get), on
>the same side of my house as the neighbour. Would a 1/4 wave counterpoise
>on the rig help?

3 meters from ground is a shorted half-wave, equivalent to a 1/4 wave
couterpoise. anyway, on VHF, ground wires are only for electrical safety.

>Please direct comments to Seeler@UPEI.ca - as I will be on vacation for the
>next 3 weeks. Hope it is time spent operating - not fixing.

From: mitch@cmptrc.lonestar.org
Message-ID: <CA9F4u.LwA@cmptrc.lonestar.org>
Source record: 279111

I'm looking for some net wisdom. Now that my code speed is starting to come back up I'm debating on going qrp for my cw work. (a lot less rfi problems than my borrowed hw101 /grin). I'm looking for thoughts on the subject as well as some ideas on decent, affordable cw qrp radios. I've been reading the adds for the MFJ radios and they look pretty good for the price I can get one locally for. Any ideas? Hints?

Thanks!

hmm, I don't think there's much difference between replacing a resistor
and adjusting a potentiometer. Maybe they should have used potentiomenters
instead in the first place so engineering afterthoughts would be easier.

:
: 2. How do I get this monster to talk to my modem or TNC (electricly,
: that is). It has an RS-232 (DB25) connector, but my friend tells
: me that these things use current-loop (?) instead of voltage-level
: signals. Anyone know what he's talking about?
:
: Thanks a lot for any help.
:
: - Jay, KE3AT

If the ribbon looks to be in good shape...no holes or worn spots...you
might get a bottle of ink that is used to re liven a rubber stamp pad.
But before you do,try it first.
Also, you might be able to buy a spool of ribbon like for an Underwood or
an Olivetti...wind it on to the TTY's spool

YES they use a "current loop" of 20 or 60 ma, as supplied by about 45-100v
dc, thru a resistor. Resistor value calculated out to give that current.

(so if using 25 vac in a volt doubler ckt...getting about 70 v you want
roughly 3500 ohms for 20ma...1000 ohms for 60 ma)

To then connect this to modern equip, get a Horizontal output transistor
whos ratings exceed 400v Vceo Vvbo , 600ma and 30-50W diss.

wire its collector to the magnets in the TTY and the resistor from the
remaining wire on the magnets, to the +70v dc
common up the "-" to grond as well as the emitter of the transistor.

Connect transistors base to 470 ohms to gnd (emitter) and ....

Well, here is what I did,and ON ham bands I did pick up 1-2 qsos...
(you wont, out side ham bands...they use scrambled code)

Run speaker leads direct to base and emitter...or via 100 ohms if radio
has a lot of audio output.
Tune in a TTY station...bfo on, and tune so you zerobeat one of the tones
leaving just the one left.
turn vol up until machine starts doing stuff.
If it comes out all martian, re-tune to zerobeat that tone and get the one

you zeroed before to be heard.
be carful to not adj vol too high or you'll ruin copy...or that transistor
if no 100 ohm resistor there.

IF they are sending at the baud rate your machine runs at, (64 and 100 I
think) then you will get copy....it'll be on one side or other of zerobeat.

If they are sending at a baud rate other than your machines speed, you'd have
change the gears (yes...change the gears), which is rather involved...

DO NOT try to adjust the speed regulator! The numbers on it are only
'relative'...you'd not be able to go from 64 to 100 baud doing that.

The above hook-up is xx crude but will let you check/see if it works and
to let you decide if or not to go further.
You can reuse that transistor in the REAL decoder (uses ne567s and a 'latch'
IC then a 741 ... etc) so after the test, you wont be wasting it.

Good luck, have fun

The Bugcatcher is an excellent mobile antenna. While it is a
little unsightly, its performance is excellent.
The manufacturer is Henry Allen, WB5TYD, in Caddo Mills, TX. His
number is 903-527-4163. He is a good friend of mine and I do NOT
get any compensation for his antennae.
If you want to here a few of them on the air, listen to 3963 late
in the evening to the Possom Trappers net. There are usually a
few of them on.

Yes, the old teletypes use a 20mA current loop. there is a book published by SAMS now that was called the Bugbook, or BugBooks. (Sorry, I got the original bugbooks when published before SAMS got them) There were circuits in there for 20mA to TTL conversion. Basically all you need is a transistor to current limit a source to 20mA for sending to the TTY and something like an optoisolator to convert 20mA to TTL. The 20mA circuit was chosen for noise immunity and automatic compensation for lon lines, I think.

I've been using MOrse trainer from Lars sundstrom. He has written a nice program. He can be reached at sund@tde.lth.se There were some problems downloading the file, though (it got doubly encoded), so he may have changed the file that you will download. He was awfully nice to put it in the public domain, and would probably be happy to help you teach your son.

Pete,

the contests are run with plain text. in fact, the world record was
done with a newswire story or newspaper article. someone else from
Australia pointed out that copy by McElroy was perfect at 70 wpm
and he started missing at 75, so they gave him 72.5. this is not
a typo on my part. i remember the value 72.5 from 25 years ago and
thought that maybe i had exchanged them then. we'll have to do some
research on this one. this is the reason why i believe libraries,
book stores, etc. should never never throw away old books.

you're right, you can 'fill in the blanks' for text, but during these tests,
immediately after the last critter is sent, the hardcopy is taken up
as soon as the contestant finishes typing the last sentence.
you don't have a chance to go back and fill in the missing
critters. now, in order to go for the world record, you're going to
have to coordinate with the ARRL and Guiness and probably several
other organizations. geeeez! what a nightmare that'd be. at
ARRL conventions, it'd be pretty easy to do.

i've heard of morse intercept operators for the government capable
of sitting down and doing over 60 wpm for hours on end. that's just
being a machine. you detach yourself from the text, since it is
encrypted and nobody in their right mind would even attempt that stunt
of decrypting. somebody would have you locked up for the wrong reasons
there. ;-)

someone asked me yesterday about copying individual critters. i was
scared to try it. reminds of the story of the centipede when asked how
it could walk with all those legs and it rolled over in the gutter trying
to think about it. but anyway, last nite i made up a tape with 1. random
5 letter code groups, 2. random calls and signal reports, 3. random words,
and plain text at 45 to 50 wpm. on the way to work this morning, 30 min
drive, i concentrated on copying individual letters and forcing myself
not to think about the word. you know, it's not all that bad after all.
i can't explain the process, just like the centipede trying explain how
it walked. i can immediately recognize every critter before the next one
comes along. i don't concentrate of dits and/or dahs. it just sounds
and the letter appears in my mind. if i don't force myself to do the
individual letters, i start hearing words on the plain text.

plain text is the easiest to do, of course. i relax and it just 'flows'.

my next test is to crank up the above to 80 wpm and see where it breaks.
you realize that i just might go over the edge on this one guys/girls.
if you don't hear from me on monday, i was killed in a car wreck on the
way to work listening to high speed morse. then the bumper stickers
will really pop out!!! don't do this while driving kids. the experiment
in the car (pickup) gets complicated and distorted without earphones.

Derek, the Brit exiled to Austin, pointed out to me this morning that
in the Low Band DXing book there is a hint to take stereo phones and
change the phase on one ear to make sound seem like it's coming from inside
the head. anyone out there in netland tried this? another point to
look at this weekend. hey, this is only a hobby..... but what fun.

ciao,

The big difference is that I haven't seen a miniature surface mount
potentiometer. It's pretty tight inside the 580 and most other HT's...

is published every week and is made available for unlimited distribution.

* PROJECT MOONRAY *
====================
In only 6 years and 5 months we will be entering the 21st century. Now is
the time to start thinking about formulating some interesting future plans
for the continuation of Amateur Radio in Space projects. During the last
few annual meetings at Project OSCAR Headquarters, a decision was made to
revive Project MOONRAY as a possible original concept that might become a
stepping-stone for more exotic projects throughout the 21st century. These
might even include additional Lunar experiments, Space-Station, Mars, Venus,
Jupiter, Asteroid, and Deep-Space Probe Amateur Packages. Although some
of these plans are certainly long-term, the originators would like to leave
Radio Amateurs world-wide with a legacy they started when they originated
Project OSCAR in 1960.

Nick Marshall, W6OLO, dreamed up the idea of putting an Amateur Repeater
on the moon in 1965 during the APOLLO manned lunar exploration program
when he met Owen Garriott, W5LFL, astronaut in training, scheduled to go
to the moon on forthcoming APOLLO 18, or 19, or 20. Nick used Project
MOONRAY, short for "Moon Relay" as an identifier for this concept. The idea
was to build a package that could fit under the seat of the Lunar Rover
vehicle. Nick had contacted NASA with this concept and they agreed to
accept a package that would fit a space vacated by the exchange of batteries
when fuel cells would be installed in the Lunar Rover vehicle. Hopefully,
Owen was to be the driver and would have been the astronaut to erect the
MOONRAY package on one of the Lunar Rover's excursions. An arrangement
was to be made to allow a special connector that would mate with Owen's
space suit headphone/microphone connector so that he could plug into the
MOONRAY package and make a few contacts with hams on Earth. He would then
leave the package and continue on his routine assignments.

Numerous articles were published about Project MOONRAY and Amateur Radio
enthusiasts world-wide were intrigued and very excited about the idea of

having a repeater that could be accessed by hams world-wide as long as they had the moon on their side of the earth. Unfortunately, Congress cut off funding for NASA for any further lunar landings beyond APOLLO 17 and the MOONRAY Project was temporarily shelved.

Lunar exploration, Lunar habitats or colonies and numerous Lunar projects have recently again surfaced. No specific dates or schedules have yet been set, however, it is not too early to plan for Amateur participation in one (or more) future Moon visits as well as for other possible "out-of-this-world" concepts.

Further information or answers to questions about the status of this project may be obtained by writing:

Honesty can be a problem for salespersons. When I was in high school, I worked at K-mart selling stereos/etc. One day, a guy came in and said that he really loved his daughter who was graduating from college and he wanted to buy her a really good stereo. After looking to be sure that my boss wasn't around, I told him that we only sold crummy stereos and that he would be much better off going to a local electronics store specializing in stereos. He was appreciative and I felt like I did the right thing. I never could lie to customers who asked about the quality of the product. Of course I was getting minimal wage and no comission. Now I see that they mostly sell name-brand stuff...

5033. SSTV video source/manipulation questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 16:05:21 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <226jk1INNafa@newsstand.cit.cornell.edu>
Source record: 279107

New Mode time - I don't know about you all, but every once in a while I get the itch to try a new mode, and with the recent flurry of PC solutions to doing slow scan tv, I fell victim and got a Pasokon board for my PC. Lots of fun watching the pictures go by on 14.230 - but now I want to send some.

I could grab some generic G-rated GIF's and send them, but I'm much more interested in getting some 'real' pictures into the system. I'm faily well equipped with video equipment from playing with ATV, but I don't have a PC based video capture board (nor will the budget support one unless it's really cheap), nor do I know much about what software can be used to manipulate the images (doing things like overlaying my call, etc)

I *do* have a Quadra 700 Macintosh at work equipped with a VideoSpigot card that can do video capture using ScreenPlay - but the file types aren't directly compatible. I've used GIFconverter, but don't get very good results (and the SSTV software would really rather see Targa .TGA files anyway) - the images are rather dark and muddy and the colors seem to be off. Usable, but barely.

What I want is some net wisdom on

a) Where to get a good program to take 24 bit video images from the mac and make them into .TGA files for the pc. I can do the disk conversion using Apple File exchange, but need an FTP site with something to massage the data into the .TGA format (or .PCX or .GIF).

b) An FTP site with a program to go in and paint over the video file after it's been made into a .TGA (or .PCX or .GIF) file.

c) if there aren't public programs for doing either or both of those, pointers to reasonably priced commerical programs.

d) information on video capture cards for the PC. (even if I could afford one right now, I don't know what ones are worth looking at or have good software - eventually I'll want one at home)

e) pointers towards any particularly good ftp sites or newgroups for this kind of stuff.

Thanks in advance

Kevin, WB2EMS - (fkf1@cornell.edu)

I've got a good story about "architectural review" to relate to the net. My wife (N5WCE) and I just made an offer on a house in a subdivision south of Austin that has an architectural review committee. Before we made the offer, we wrote the architectural review committee and requested a written statement indicating that we could put up a 60 foot tower. I wound up spending about half an hour on the phone with two members of the committee and then they signed it! No agreements of non-interference, curtailed hours, ugly antennas, etc.!

What's really remarkable about the whole thing is that we had chosen the subdivision as one we particularly liked, gotten the agreement, and then found the house. A little preparation went a long way here because the house was at a fair price and there were two offers made on it within 24 hours.

Here's hoping things keep working out as well w.r.t. antennas!

Hi! I built 4 of them. 1 identical to the plans and another using double ducky antenna system. The third has two single full wave element as antennas. Finally, the fourth (still in work) will have two 3-element beams. It seems to be more directive (better nulling) when the antennas are spaced at least a quarter wave (half is better) away from each other. I have used the first two in several local fox hunts and was very successful (second, third, first place). I'm recently sold the first two equipment at a tailgate ($$$ for more parts) and currently using the third along with working on the fourth.

I had some mods which seemed to help:
(1) Try using a variable cap and pot for the audible tone.
(2) Replace the 3-position DPDT switch (harder to find) with a SPST and connect pin 9 directly to ground
(3) Try using other types of diodes (1N4148 didn't seemed to work as well as some others 1N914, 1N4151, 1N4153, etc... I even tried some Zener and Germaniums)

If you have other ideas please pass them along...
TNX,
Tom

5036. Re: IC-730 RF Problem

Source record: 279110

Sounds like you're getting RF into the supply regulation circuit. I have the same problem with my supply here and my TS-120s, since I'm about 20 ft from my antenna. The solution: Go to Radio Shack and buy some toroids, both the wrap around type (looks like a square ring) and one of the phone chord types (looks like a little cylinder). Wrap your DC line from the rig around the square toroid, and put the cylinder on the feedline where it enters the room. Things should improve quite a bit.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 16 to July 25, 1993

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

THE WEEKLY SOLAR TERRESTRIAL FORECAST AND REVIEW FOR JULY 23
TO AUGUST 1 (NEXT WEEK) WILL NOT BE AVAILABLE.

!!*!*!*!*!* NOTE *!*!*!*!*!*!*

Version 2.00 of our Professional Dynamic Auroral Oval Simulator is now available. Completely rewritten, this software now produces numerous types of map projections centered on any geographical location, including OBLIQUE AZIMUTHAL EQUIDISTANT maps where radio signal paths are projected as straight lines. Precise DMSP Satellite Observations of Auroral Activity characteristics are also plottable for any hour of any day from December 1983 to 1992, making this the most extensive and contiguous database of auroral activity observations presently available. Valuable for radio communicators, aurora photographers, and astronomers. The software is now Windows 3.x compatible and will operate under either Mouse or Keyboard control. Many additional features are also included. Contact Oler@Rho.Uleth.CA, or COler@Solar.Stanford.Edu for more information or call our computer BBS at (403) 756-3008. A recorded message containing additional information is also available at: (403) 756-2386.

Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

```

CONFIDENCE LEVEL: 75%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over

periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

```

Chart Start Date: Day #137

NOTES:
This graph is determined by plotting the greater of either the planetary
A-index or the Boulder A-index. Graph lines are labelled according
to the severity of the activity which occurred on each day. The left-
hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

Chart Start: Day #137

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

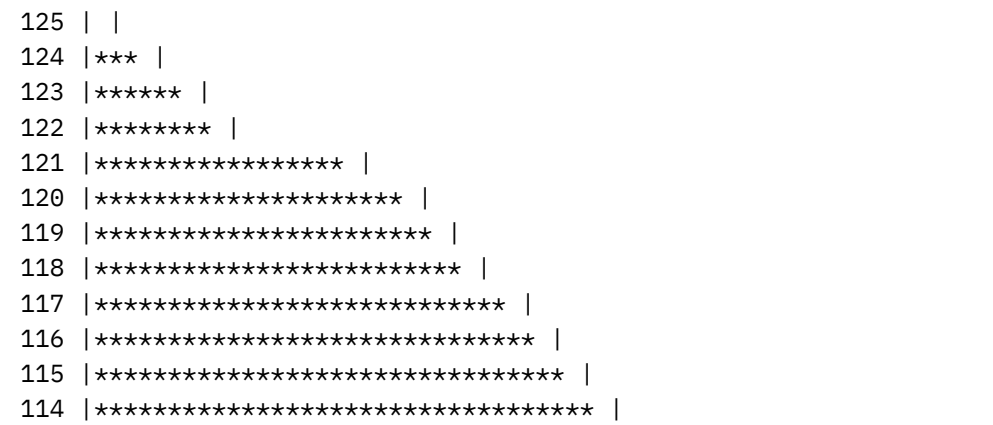

Chart Start: Day #137

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

NOTE:
Version 2.00 of our Professional Dynamic Auroral Oval Simulation Software Package is now available. This professional software is particularly valuable to radio communicators, aurora photographers, educators, and astronomers. For more information regarding this software, contact: "Oler@Rho.Uleth.CA", or "COler@Solar.Stanford.Edu".

For more information regarding these charts, send a request for the document, "Understanding Solar Terrestrial Reports" to: "Oler@Rho.Uleth.Ca" or to: "COler@Solar.Stanford.Edu". This document, as well as others and related data/forecasts exist on the STD BBS at: (403) 756-3008.

5038. ARES help in FLOOD zone???

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 16:31:50 UTC
From: ppddgc@uwovax.uwo.ca
Message-ID: <1993Jul16.123150.1@uwovax.uwo.ca>
Source record: 279106

Does anyone have any first hand knowledge of any Amateur Radio involvement in the flooded parts of the US midwest? Our Red Cross is sending some volunteers including some hams and any information would be of interest.

Dave Colvin VE3ZDC
University of Western Ontario
London, Ontario Canada

5039. Req Verification of ARSENE Epoch 171

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 16:32:15 UTC
From: G_RCAMPBELL@qualcomm.com
Message-ID: <742836735.0.G_RCAMPBELL@NIKE.QUALCOMM.COM>
Source record: 279094

I have moved ARSENE into the OSCARS bulletin (from thre e MICROSAT BUull().

Also, NASA has listed Epoch 171 for ARSENE. Please let me know if this
is agood set or not.

Tnx & 73, Dick

|>

Randy,

thank you, thank you, thank you. ;-)

do you realize we'll have to call this the Adams Effect, named after
the discoverer!!! i wonder if any doctor, group of doctors, ear
specialists or others have known about this. i outta get a Nobel
Prize for this one......

you'd think that with a pair of monophones you'd get the same effect,
but you don't. this is gonna take somebody a 1,000,000 dollar research
grant from the US Government to investigate.

ok, time stamp last years posting and this thread and put it in the
record books.

Randy, i owe you lunch (under $20) at the restaurant of choice.
locally, not in Paris or Honolulu..... ;-)

let me know and i'll drop you a money order.

thanks,

p.s. what's your code speed Randy? could this be a cause or an effect?

5043. Did YOU get cards for these?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 16:58:08 UTC
From: milewski@oregon.uoregon.edu
Message-ID: <milewski-160793094834@fp2-st-affairs-16.uoregon.edu>
Source record: 279109

This past winter I worked a bunch of new 80 and 40 meter countries and am wondering if anyone else has received cards yet for the following. If you have, I've indicated the date I worked them - did you have to wait longer than this for YOUR direct responses?:

TI2SR - Feb. 10, 1993
3X0HNU via F6FNU Feb. 10, 1993
ZK1AZY Dec. 8, 1992
ZK1UO - Feb. 11, 1993
VR6BB via JF2KOZ - Jan. 19, 1993
VP8CLR on South Georgia via an address in Wales - Dec. 6, 1992
T32VU via DJ3TF - Dec. 4, 1992
XU1UN Nov.21, 1992 (any route suggestions on this one?)
PJ2AM - Nov. 17, 1992
HR2IQC via JF1NZW - Nov. 18, 1992
HJ6UDH via HP6KCS - Nov. 8, 1992
HP8ADU - Nov. 3, 1992

Thanks for any help. I'm trying to figure out if it's time to re-QSL.

Thanks,
Steve/AA7FL

5044. Ham software for Unix?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 17:04:37 UTC
From: markm@bigfoot.sps.mot.com
Message-ID: <1993Jul16.170437.23064@newsgate.sps.mot.com>
Source record: 279115

I'm looking for ham related software to run under Unix, specifically 386BSD and X-windows. Things like nifty TNC terminal programs, satellite trakers, logging programs, etc. I know some of them exist but I wasn't paying attention when they were announced. Any info will be appreciated.

I'd also be interested to hear from anyone who is using a Unix box (any flavor) as a ham-shack computer.

Thanks & 73... Mark AA7TA

>...To make matters worse, under
>some circumstances, I can get a perfect 1:1 match with about 10w output, but
>when i turn up the juice, the rig immediately turns off...

I had a similar problem with an IC-725 plus tuner. Your antenna is probably
arcing at a certain voltage. The voltage is not high enough to arc at 10w
but is high enough at 100w. The voltages on a "random wire" can be pretty
high. Consider shoving 100w into 2000-j2000 and calculate the voltage.
It might even be arcing inside the antenna tuner or balun if you have one.
My setup arced to my water bed, my window frame, and a tree. I had to get
the wire about six inches away from anything and everything to get rid of
the problem.

>shovel snow! 73, Cecil, KG7BK

Hey Cecil! Guess what? My neighbor has put up a "For Sale" sign on his house, so it's time to play antennas. I have some 12 ga copper-clad steel wire put away. I think I will make some super strong feeders with say teflon rod spacers that can survive ice slides. I had used 14 ga multi-strand with the good old Johnson ceramic spacers, and that breaks easy with a minor slide <G>. Also, I could make a little "dog house" to put over the feeders where the roof overhangs, to provide some protection. I support the center of my G5RV with a 45-foot mast made of PVC pipe that is guyed with polyester rope. I could put a cross-arm at the base of the mast to support the copper clad steel feeders that run back to the window ledge.

Thanks for the responces about MPF102 replacement...
I am posting a (usefull I think) summary.

73 de George (SV3CHA)

****

Hi, George...If memory serves me, I believe the 2N4416 is a suitable
drop-in replacement for the MPF102. The QST "Ugly Weekender" project
from a decade or so ago uses the 2N4416 in the VFO (if I am recalling
correctly); seems like the article noted that an MPF102 could be used
instead, but the VFO output would be reduced somewhat.

This is all from memory--I don't have the article in front of me.
Sorry...
73 de aa0ms

****

I'm a bit baffled by your request. The MPF102 is by far the most
commonly available VHF JFET, at least here in the States. There are
lots of second sources; it certainly doesn't have to come from Motorola.

Are you having trouble finding it, or are you looking for a similar
part for some other application? Most MPF102 applications will work
with any small-signal JFET with Ft above 500 MHz or so.

73 de ke9tv/2, Kevin KENNY GE Corporate R&D, Niskayuna, New York, USA

****

Almost any jfet will work.

Even the pack of 10 on a card from 'rat shit shack' will usually work
as an mpf102.

Most of them are good to about 10 mhz, but you need to check the biasing
resistor on each and every one, since tolerances are HUGE.

Bob

****

Hi...I was able to get them from Radio Shack! I also got a replacement...
I'll try to look up the number in my handbook tonight.

Anyway, after I got a replacement part from a mail-order place, I found
one in a Radio Shack in Santa Fe. It is a standard stock item....

-Tom
KJ5LT

****

The MPF102 was the "economy" version of an RF N-Channel J-FET, as I recall. I've searched my Motorola literature, and can find no reference to it any more recent than 1974.

A better transistor of that generation, that is still available, is the 2N4416A. It is in a metal can instead of the plastic case, and has higher gain than the MPF102. Another transistor that may be useful is the 2N3821. I'm not familiar with it, but it is listed along with the 2N4416A, in the 1992 issue of the Motorola "Master Selection Guide".

73, Fred, K4DII
****

The 2N4416 is similar and more tightly specified. It's a good replacement choice.

Roy Lewallen, W7EL

****

Well, you could try using a ... MPF102! They are easily found, and currently manufacturered. Check Digi-key, or Jameco, or Mouser, or DC Electronics, or... you get the idea. You might even be able to still get them from Radio Shark.

73,

Chuck Harris - WA3UQV
chuck@eng.umd.edu

****

Gee, I haven't had any trouble finding it until now.

Anyway, it depends some on the application. Devices with similar specs include:

2N5457-2N5459 (VHF)
2N5484-2N5486 (general purpose)
2N4416 (RF)
J308-J310
NTE/ECG 451-452

No guarantees that any of them will be a plug-in direct replacement in any given application, but some creative reading of the specs should allow you to adapt the circuit.

Some of these have a higher gain-bandwidth product than the MPF102, so you may need to add some impedance to the gate lead to suppress VHF/UHF parasitics, depending on the circuit layout.

73 de ke9tv/2, Kevin

****

The NTE replacement for the MPF-102 is the NTE451;
J Fet N-Ch. VHF/UHF amp, TO92
Cheers;

>|Robert D. Penrod | Excess on occasion is |

if you're looking under "Amature" instead of "Amateur", I would expect to get the results you did. 8) On the other hand, I would have expected the results you obtained anyway. 8(

Checking the Orlando Sentinel database from the local public library, most of the stories on amateur radio are in the Obituaries columns (so-and-so was a member of OARC etc.), with the Shuttle stories (astronaut's hobbies include blather, blah and amateur radio).

What sort of stories would you expect to see?

I bet if we could get the number of hams up to about 2% of the total US population, (with a fair number active), we could begin to reverse some of this anti-ham opinion just because more people would know someone who was an amateur. 600K in 230 M just isn't enough.

It wouldn't hurt to check the libraries in your town and see how they are fixed for current amateur radio information (give 'em your 3 year old handbook and buy a new one if the library is way out of date...). In most cases, i'll bet the library is about 25 years behind (that's 1968 and things have changed quite a bit since then.)

>
>I recently became the proud owner of a real honest-to-god
>Teletype(TM). Two questions:

Ah the smell of burning grease and the sound of a real TTY! Rather, as my EX useda say:"Like a metal cabinet full of dishes being shaken!" Ok so hopefully you've got either a Model 15 with reperforator, or an ASR33 - the rest of them are mostly junk! But serviceable...the Model 15 does REAL BAUDOT - NO PROBLEM WITH CONVERTING THE CODES! The ASR33 was near the end...actually the last ttys were Model 43's those were wimpy compared to the ASR33. There are probably as many parts available for the ASR33 as there are for Chevy "Stovebolt" 6's! ..there was also a Model 35 which was an updated Model 33...the Wire Services used these damn things and they are pretty near indestructable!

>1. The ribbon is pretty dry. Is there some way to re-ink it? Do I
> have a prayer of finding Teletype ribbons.
>
Believe it or not, you can probably get it to print fairly well by just spraying it with something like WD40! Some mobile-oily fluid to melt the dry ink is just what the Dr. ordered here. Remove the ribbon reels, spray the whole mess, wrap it in foil and put it somewhere WARM for a few days.. ..I put mine atop the water heater. The combination of the WD40 and the heat revitalized the remaining ink on the ribbon. You can also reink them but I'll warn you, its very messy and you need to soak the ribbon in a cleaner/solvent first to get rid of the dirt/old ink first..almost not worth it!

You might call around to the various terminal/typewriter repair places, as I recall the one for the Model ASR33's was the same as a very popular Smith Corona.

>2. How do I get this monster to talk to my modem or TNC (electricly,
> that is). It has an RS-232 (DB25) connector, but my friend tells
> me that these things use current-loop (?) instead of voltage-level
> signals. Anyone know what he's talking about?

Yep, it's true. You will need a current-loop to RS232c converter circuit, look in the Radio Amateur's Handbook, it's really quite simple - just a couple of transistors to convert the 20mA current pulses into the pluse and minus voltages (12v) for RS232c.

Keep in mind that these things run S L O W!!!! A tty running at 300 baud (yes you CAN get gear sets to do this with an ASR33!) is still very slow compared to the 9.6 or faster terminal/sparc/pc/x-station that you're accustomed to..also the stock gear sets for ASR33's is 110 baud...slower yet! The Model 15 runs at 50

or 57 baud...

5050. non-resonant antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 18:27:11 UTC
From: Cecil_A_Moore@ccm.hf.INTel.COM
Message-ID: <930716102711_4@ccm.hf.intel.com>
Source record: 279112

I've said a lot lately about G5RVs, center-fed Zepps, etc. lately. I want to share an interesting thing about the operation of my 105' center-fed at 28.4 MHz. This antenna loaded through my balanced antenna tuner very well on all Ham bands including the upper part of 10m. But I couldn't get it to load around 28.4 MHz unless I varied the length of the trans-mission line. How bad could it be at 28.4 MHz?

I laughed after making the measurements to determine what was wrong. I'm using 300 ohm 'AirLine' and the SWR was 4/1 which transformed the 300 ohm transmission line impedence to exactly 50 ohms resistive at 28.4 MHz. It was the perfect match for my transmitter and one that I couldn't match with my antenna tuner.

I think you're still being a bit too hard on Heathkit.
Take the SB-102, for example. It doesn't have a phase-
locked loop, digital readout, or 100 memories, but
neither did any other rig of its day. It does have
a 1 kHz readout dial, good stability, and adequate
sensitivity and selectivity.

Or an even older rig like the Apache transmitter /
Mohawk receiver. They were both pretty good radios
for their day.

Mohan Pakkurti (mohan@tulip) wrote:
: Hello,

: I am waiting for the license and wanted to make an antenna for HF operation.

: If I want to construct a center-fed dipole for the 7.1 Mhz band,
: the dimension for the dipole is given as 65ft, 11in.
: Now, is this the distance between the holes of the insulators at the
: support ends (including the length of the middle insulator/spacer), or is it
: just the length of the wire not including the middle spacer.

The short answer is it is the overall length, including center insulator.
But it really doesn't make any difference, because the resonant length
will vary from installation-to-installation depending on wire diameter,
height above ground, proximity to nearby trees and conductors, angle
between the two wires, etc.

It's best to cut the antenna a foot or two longer than the formula,
put it up in the air, and measure the SWR across the band. If the
lowest SWR occurs at the bottom of the band, then the antenna is too
long. Lower it down and shorten it and try again. After a few
iterations, you'll have it tuned up on the desired frequency.

: And if I use a TS-520S transceiver and a dipole antenna made as in reference 1,
: the transmitter and the antenna will be matched without me having to use
: antenna tuners, and what about the SWR ?

Again, the SWR you end up with depends on the particular installation.
An infinitely-thin dipole in free space it about 73 ohms, which would
give a 1.46:1 SWR (with 50-ohm coax) at resonance. However, fatter
wire and ground reflections tend to lower the impedance, so you typically
get a pretty good match.

>Interesting! Randy, KA1UNW

Hmmmm, I tried this, but the only source I had was one of those thingies
they put inside birthday cards that play "Happy Birthday" when you open
the card - fairly pure tones but of course different pitches. I couldn't
reproduce this effect, but then I can't copy CW at 60+ wpm either....

I do know that when I dropped said sounder (sounding happily away) in
my very messy office, it took ages to find it - I eventually located
it somewhere very different from where I thought the sound source was.
So perhaps my ears are only Slightly Silly and that's why I can't do
60+ wpm.

Hey, wait! E'en as I was penning these words, I thought of another way.
I set up my terminal to do a continuous (keyboard) beep, and waggled my
head around in front of it. The sound definitely goes down in volume at
one place, it doesn't quite disappear but almost. Wow, perhaps I can do
60+ now!

This has lots of interesting possibilities especially if, as Randy, says,
the null point is different for different tones. It means that if you
are listening to two closely-spaced CW signals via a loudspeaker, you
can null one of them and still hear the other one by putting your head
in the right place in front of the speaker. Gad, it's almost enough to
make you want to listen to 40m DX phone signals, if you can remove the CW
ones with this technique. It would be nice to do it the other way round!

>1. The ribbon is pretty dry. Is there some way to re-ink it? Do I
> have a prayer of finding Teletype ribbons.

could reink it, but drop by your office supply store and look in the typewriter ribbon area - TTY ribbons were interchangable with old typewriter ribbons. The same design was also used on some printers (notably Okidata used spools rather than a ribbon cassette scheme early on). take one of the spools with you so you can check the center hole size, spool diameter and height before purchase.

that would be a start...a regular typewriter ribbon is probably 2 color (red/black), but if they have those, they probably have the "computer" ribbons in all black as well.

5062. 10 ELECTRICAL COMMANDMENTS

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 21:56:43 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9307162155.AA14099@netmail.microsoft.com>
Source record: 279032

I didn't write these ...

<forwards electrocuted>

The Ten Commandments
of Electrical Safety

I. Beware of the lightning that lurketh in an undischarged capacitor lest it cause thee to bounce upon thy buttocks in a most embarrassing manner.

II. Cause thou the switch that supplieth large quantities of juice to be opened and thusly tagged, that thy days may be long in this earthly vale of tears.

III. Prove to thyself that all circuits that radiateth and upon which thou worketh are grounded and thusly tagged, lest they lift thee to a radio frequency potential and causeth thee to make like a radiator also.

IV. Tarry thou not amongst those fools that engage in intentional shocks, for they are not long for this world and are surely unbelievers.

V. Take care thou useth the proper method when thou takest the measures of high voltage circuits so that thou dost not incinerate both thee and thy test meter, for verily, though thou hast no stock number and can be easily surveyed, the test meter has one and as a consequence will bringeth much woe unto the supply officer.

VI. Take care thou tamperest not with interlocks and safety devices lest this incurreth the wrath of thy supervisor and bring the fury of the safety officer upon his head.

VII. Work thou not on energized equipment for if thou doest so thy shipmates will surely be buying beers for thy widow and consoling her in certain ways not generally acceptable to thee.

VIII. Verily, verily I say unto thee never service equipment alone for electrical cooking is a slow process and thou might sizzle in thy own fat upon a hot circuit for hour on end before thy maker sees fit to end thy misery and drag thee into his fold.

IX. Trifle thee not with radioactive tubes and like substances, lest thou commence to glow in the dark like a lightning bug and thy spouse be frustrated and have no further use for thee except for thy wages.

X. Thou shalt not make unauthorized modifications to equipment, but causeth instead to be recorded all technical directives and authorized modifications made by thee, lest thy successor tear his hear and go slowly mad in his attempt to decide what manner of creature hath made a nest in the wiring of such equipment.

George (SV3CHA) writes:
>Any idea for replacing the MPF102 FET for use in ARRL handbook(s) projects ?

I've been using the 2N5245 J-FET (plastic TO-92 style case) for many years and have found it to be quite satisfactory in applications designated to use the MPF-102 device. The 2N5245 has a gm of 1000 at 400mhz, which I believe is higher than that of the MPF-102. Also, the 2N5245 is bipolar (symetrical construction) in that it tolerates a polarity interchange between the source and drain terminals without a degradation in gain.

There are three devices in the family and any one should substitute well for the MPF-102: 2N5245, 2N5246 and 2N5247

Riku-

I suggest you get information about the products of "Communications Specialists". They are located in the U.S., and manufacture CTCSS encoders and decoders. Their model TS-32P is a field programmable CTCSS encoder-decoder, programmable by DIP switches. I would suspect the DIP switch leads could be interfaced to a CPU instead. They may be willing to sell just the chip.

I do not have information about their address. I have purchased their products from Amateur Electronic Supply. A.E.S. has a main office at 5710 W. Good Hope Road; Milwaukee, WI 53223.

Paul-

I seriously doubt the contents of the memory would affect current. I had the understanding that the receive current rating assumed the combination of maximum back lighting and a maximum volume tone being received. Mine doesn't get hot enough to make me think it is disipating 25 watts!

5066. Icom, there when needed?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-16 23:17:57 UTC
From: russell@cbnewsd.cb.att.com
Message-ID: <CAA61y.36n@cbnewsd.cb.att.com>
Source record: 279035

This post is not meant to put down Icom. I just wish to relay a story, one that is not over yet. Whether there is a happy ending or a sad ending to this story, I'll let you now when I find out.

My W2A was sent in for service. It was in once before when one side of the radio stopped functioning due to a bad solder joint. That time it was under warranty ... this time it was not as it is almost 2 years old.

The W2A had been scanning for a good part of the day. It was sitting on my desk when I saw it was off. I use the 30 minute off timer so figuring that's what turned it off, I turned it back on. Only problem was that it didn't turn on. I figured the battery was dead and removed it and put on my other battery pack. The W2A would still not turn on. Thinking that I may not have charged the other battery, I connected the W2A to my regulated power supply. Still no power up. I turned off the power supply and removed the battery pack. As I looked at the W2A, I caught a whiff of that burnt electrical component smell. How did this happen?

I sent the W2A to Icom and got a message on my answering machine a quick 4 days after sending it to them. The message said "your W2A is not economical to repair". Hu? I never even thought of that possibility.

I called the next day and was told that the unit would cost over $400 to repair! All the boards needed to be replaced except the logic board which was able to be repaired. One possible explanation given to me (after I explained to the technician how the radio died) was that it could have been caused by reverse polarity. From the battery packs? The unit died while under battery power. A check of my second battery pack showed that it was charged up. I'd love to know what really happend.

Maybe I just bought the wrong radio at the wrong time. I know this is a very unusaul position to be in, but I don't think that paying about $529 (at the time) for an Ht and then having to junk it in less than 2 years is acceptable.

The technician I spoke to said that someone from their main office is going to call me. I have no idea if Icom has a set way of handling this type of unusual situation, but I'll find out. Then I can let all of you know if Icom is there for you when you really need them.

>critical as in athletics. most of the high speed critters are OFs and

Now, waaaaaaaaait a minute there! When I was 15 and trying desperately to get my General, I got my code speed up to 25-30 WPM at solid copy and a bit faster with the occasional mistake. Now that I'm 42 (even if that doesn't qualify me as an OF, the fact that I've been licensed for 28 years should), I'm down to just barely about 13 WPM and need to warm up a bit before I get _that_ good.

>i think it's just practice. when you get old, you don't have anything
>else to do. :-) speed is proportional to the number of hours listening?

Well, there's always knitting, puttering in the workshop, getting on a repeater and telling all the young-sounding folk how they should operate... I think you've got it there. Speed is proportional to the time spent trying to get your speed up.

SB DX @ ALLBBS $RTDX0716
VK2SG RTTY DX Notes, 16 July
VK2SG RTTY DX Notes for week ending 16 July 1993 (BID RTDX0716)

There was bad news this week for all those who aspire to a RTTY DXCC
Honor Roll. According to ARRL DX Bulletin 36, the ARRL DX Advisory
Committee voted down a proposal, 10 to 6, to add band or mode-specific
Honor Rolls to the DXCC program, citing concern about a proliferation
of awards. Why this should be a problem, now that the DXCC records
are computerized, is not at all clear.

Our thanks this week for the input go to 4X6UO, CE3GDN, DJ3IW and the
Central Europe DX-Cluster node DB0SPC, I5FLN, VK2SG, WB2CJL, ZS5S and
the NJ0M node of the Twin-Cities DX-Packet cluster network.

In spite of somewhat spotty propagation, we can report the following.

Notes of Interest:

Franz, DJ9ZB ET AL will operate from Eritera, E3, for at least 12 days starting the first or second week of August. RTTY is definite.

The BV9P operation from Pratas Island has again been moved, to some time in August.

A group of Japanese hams will operate from KC6, Belau, from August 8-13 using all modes, 160-10 meters including the WARC bands. Calls include KC6IG, KC6IJ, KC6IL, KC6IM, KC6KY, KC6LI, KC6OG, KC6TZ, and KC6UP. QSL all to JA3OIN. (Tnx DX Magazine)

For next week's Bulletin, send your Notes and Bandpass to Luciano, I5FLN @ ZS5S.ZAF.AF or I5FLN @ 9X5LJ.#KGL.RWA.AF

5074. Re: Converting 49 mhz stuff, and 6-meters questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 05:02:11 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCAALzn.H74@netcom.com>
Source record: 279045
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment

I once took an AM supergenerative toy walkie talkie and replaced the 49MHz crystal to 50.585MHz. That freq was a crystal laying around in the junk box. Took it over to a ham friend's house, who had a 6M and 2M rig set up to do cross repeat. Had a QSO with the toy cross repeated to a 2M repeater to a random ham. Took a while to explain the equipment.

Should also be possible to make 10M toys by recrystaling old toy CB talkies.

I noticed this effect once when visiting my dad who is deaf and wears hearing
aids. I was watching tv and heard a very high pitched sound. The sound I later
found out was one of his hearing aids with full blown feed back, not un usual
for hearing aids. The hearing aid was in another room and I could find a very
sharp null by turing my head from side to side. It was certianly phase cancilation but in
my case there was a reflected path so the acoustics of the room
likely come into play.

5077. Where do I find kits?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 08:23:38 UTC
From: fsrla@aurora.alaska.edu
Message-ID: <1993Jul17.002338.1@aurora.alaska.edu>
Source record: 279048

First off, my apologies if this message looks funny.
I'm using a computer I'm not used too......

Anyway, I'm relativly new to the Amatuer Radio field.
Don't have my license yet, but the test is on the first
Saturday of August.
Well, what I'd like to know is this. I want to learn more
about the technical, tinkering, gizmo gadgety kind of stuff.
So I'm courious as to where to find low cost kits for just
about ANYTHING. Multi-meters, radios, etc..... The Radio
Shack in town here doesn't seem to really carry all that much.
Are there mail order place? If so, what are the addresses?
Any help is needed and my thanks in advance!

Please E-mail me at: FSRLA@AURORA.ALASKA.EDU!
Thanks, again! ROG!

5078. Here is MARS/CAP expansion for Std. C528A or Hth. HW-24-T

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 11:54:15 UTC
From: wtm@uhura.neoucom.edu
Message-ID: <1993Jul17.115415.14940@uhura.neoucom.edu>
Source record: 279049

Here is a copy of the original sheet form Heathkit. The ht-24-t is abosolutely identical to the C528A. Both are manufactured by Marantz of Japan.

Note: I did not need to press reset before entering the modification sequence. The memories I had programmed stayed intact.

Note: If you change UHF bands, the contents of whatever memory is up when you change bands may be modified. Be sure to change to VFO mode before changing bands. The radio transmits anywhere, excpet for the 800-900 MHz region.

Note: You need an apropriate license to transmit on the freqencies enabled by the expansion process. Unauthorized transmissions may be lead to undesirable attention, emberassment and action by unsympathetic government agencies. In some locations, it may not be lawful to montior and/or disclose content of trnasmissions in the 800-900 MHz region. Use discression.

Note: Not responsible for scanning errors in text below. This came from the original Heath sheet and I've checked it carefully. Use at your own risk.

Question: Does anybody know if there is a function code on the C528A that enables muting of the speaker on the opposite band when transmitting? I am interested in using the radio on UHF/VHF split, and want to avoid audio feedback.

73,
Bill

HEATH COMPANY TECHNICAL ASSISTANCE
BENTON HARBOR, MICHIGAN 49022
616-982-3296

MARS and CAP modification for HW-24-T

Dear Customer:

In order to modify your Heath HW-24-T handheld transceiver to transmit out of band, please enter the code below from your keypad. After the code is entered you can use your transceiver to transmit on the CAP and MARS frequencies.

Please keep this modification procedure in a safe place. If you ever reset your transceiver, you will need to enter the code again.

-- Push RESET
-- Press FUNCTION (hold) and 0
-- Press FUNCTION (hold) and ENT
-- Press PTT (briefly)
-- Press UHF
-- Press FUNCTION (hold) and L (lamp)
-- Press FUNCTION (hold) and 0
-- Press FUNCTION (hold) and CODE
-- Press FUNCTION (hold) and L (lamp)
-- Press FUNCTION (hold) and 3
-- Press PTT (briefly)
-- Press VHF
-- Press FUNCTION (hold) and STEP
-- Select 12.5 KHz (with rotary selector knob)
-- Press PTT (briefly)
-- Press FUNCTION (hold) and 8
-- Press FUNCTION (hold) and 8
-- Press FUNCTION (hold) and 7
-- Press FUNCTION (hold) and 7
-- Press FUNCTION (hold) and MS.M
-- Select 144.9875 MHz. (with rotary selector knob)
-- Press FUNCTION (hold) and 0
-- Press FUNCTION (hold) and ENT
-- Press PTT (briefly)
-- Press FUNCTION (hold) and 0
-- Press FUNCTION (hold) and MS.M
-- Press PTT (briefly)

In addition to transmitting out of band, you can also receive the frequencies between 300 - 400 and 800 - 900 MHz. To do this use the code below.

-- Press UHF
-- Press FUNCTION (hold) and SET
-- Press FUNCTION (hold) and 3 (this will select bands)

5079. Icom is there for you!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 12:24:47 UTC
From: russell@cbnewsd.cb.att.com
Message-ID: <CAB6HD.Cs6@cbnewsd.cb.att.com>
Source record: 279051

My story has a happy ending! In my post "Icom there when needed?"
I told how my 2 year old W2A was deemed "uneconomical to repair". I
felt that junking such an expensive two year old radio was unacceptable.

I got a call from Icom later Friday evening. I was told that my W2A
was fixed. This really took me by suprise. I was told that other
problems were found with the radio that made it look like the other
modules (boards) were bad. After fixing these problems, the radio
worked. The total cost to me, about $146. That is much better than
having to junk the radio and replace it for over $400.

I am extremely happy that Icom took the extra time to give my W2A a
second look. They could have just stuck with the initial diagnosis and
told me to get lost, but they didn't.

Icom is there for you when you need them! Thanks Icom!

From: ebe+@pitt.edu
Message-ID: <16713@blue.cis.pitt.edu>
Source record: 279053

Greg:

Many cable co.s put wide-band fm in the cable mid-band, 88-108Mhz. Just hook the cable to your antenna and tune.

This is not DMX. The DMX info is actually digital information and requires a decoder box to hear.

Does anyone know how DMX is transmitted on cable? There are 14 stereo channels on our cable system. Is this multiplexed onto a video carrier? Any idea what it would look like on a spectrum analyzer?

Elmer Beachley etb@cs.pitt.edu

5081. Re: CW in weird places

Newsgroup: rec.radio.amateur.misc

Source record: 279050

Most, if not all, US domestic satellite transponders carry AFM morse IDers. The subcarrier is usually around 7 MHz on the given channel. There is a possiblility that the cable company was tuning things up and had their downlink receiver set the IDer, rather than the usual 6.2/6.8 MHz audio carrier. This is probably pretty helpful on some videociphered channels that don't carry a barker on the standard frequency.

73,
Bill

YES!---when copying CW and things get crowded, that is JUST what I do:

I tip my head, one way or another, etc to 'hear' the signal better.

By the time I reset my dial and or select a narrower band width, I've dropped the pencil, it rolls away and I bump the dial trying to fish around for the pencil!

Other people say I have a ball bearing that rolls around in my head and I am trying to get it to sit in the right place to not block the sound.

So, maybe I'm a UFO/ alien? wooo!

5083. Alinco DJ-580 and New Duckie

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 17:26:19 UTC
From: andy@clark.net
Message-ID: <229cnr$hjg@sun1.clark.net>
Source record: 279054

The following is not to be construed as an advertisement for Larsen. Recently I purchased their model KD4 2/70 dual-band rubber duck for my Alinco DJ-580. I did some comparisons between it and the supplied antenna. I used a field strength meter at a distance of 10 feet, with field strength antennas cut for the band tested. I used a relative scale of 1 to 10 on the fs meter. Of course, this is not a "scientific" test, but here's what I found, relatively speaking:

VHF (146.52 MHz): Larsen = 10 Alinco = 1.0
UHF (446.00 MHz): Larsen = 10 Alinco = 2.5

On receive, I didn't notice a major difference between the two ducks. Sometimes the Larsen gave me an extra S-unit, sometimes not. The Larsen Kulrod is only about 3" longer than the supplied Alinco.

>| Cliff Sharp | clifto@indep1.chi.il.us OR clifto@indep1.uucp |

Cliff,

This strikes me as cutting off your nose to spite your face.

Consider the following:

In Foster City, CA..one of the hardest places in the country to be a
ham radio operator (a real nasty lawsuit that has been going on since
around 1986 if memory serves) we've just now formed an ARES unit.

Mind you several of the people involved with the suit are people like
an ex-mayor, etc. So this is a real down-and-dirty situation. But
when we put out the call to hams in the city to meet to form a group
we got a 35% turnout of the ham population...and this only WEEKS
after there was some real awful press in the local paper about the
suit.

Why do these people want to come out, train, and be ready for our next
little roller coaster ride? Well, mostly, I'd guess they figure that
they can PROVE to their neighbors, and the city in general, that they
are more than useful folks to have around when the world falls apart.

They won't be able to do that unless they do train, and also work themselves
into the emergency plans of the city government, i.e. so they can be/will
be used. Another important point is that there are 6-8 hams on the
police and fire department professional staff that want them there! These
folks will be be busy doing their jobs and won't have time to be ham
radio operators, but they do know we can do some good for the city
and make their lives easier in the balance during an emergency.

So my point is that it might be better to turn the other cheek and dig in and get to work and get the training...cause then you can show the doubters why you are useful when an emergency finally does occur. Otherwise you won't be ready!

5085. Problem with YAESU DVS-II recorder on FT1000

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 18:29:23 UTC
From: garland@ohstpy.mps.ohio-state.edu
Message-ID: <2486.2c480cc3@ohstpy.mps.ohio-state.edu>
Source record: 279056

Anyone got any advice on curing a problem with my DVS-II digital voice recorder on my Yaesu FT-1000D? The problem is that the recorder locks up intermittently when the transceiver is powered up, requiring a reset of the microprocessor (and a corresponding erasure of all the memories). I have a friend who's DVS-II does the same thing, and Yaesu service hasn't been able to help. As I recall, he's sent his back several times, but to no avail.

No. You can think of the antenna as a coupling transformer from the
transmission line to the impedance of the "ether". Unlike a simple
lumped transformer, however, it is optimized to maximize radiation.
A clear, and somewhat simple discussion of *why* an antenna radiates
would be appropriate if someone would like to attempt it.

5088. Balun phasing: How to measure???

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 21:47:00 UTC
From: oopdavid@ubvms.cc.buffalo.edu
Message-ID: <CABwF5.45r@acsu.buffalo.edu>
Source record: 279058

Has anyone an idea on how one would measure the balun terminal orientation in order to phase several antennas so that the "center" terminal is always going in the same direction? Assume the baluns are the 1:1 variety, like the W2AU type and have no external markings. 73, Dave.

5089. Calls Re-issued?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-17 22:11:42 UTC
From: eesnyder@boulder.Colorado.EDU
Message-ID: <eesnyder.742947102@beagle>

Take a look on N8EMR's BBS (and if anyone has suggestions on other BBS systems with UNIX ham stuff, please, do let me know!). I've seen satellite tracking programs. What I saw was text-based, but then, I wasn't running X until today, so I wasn't looking for non-text stuff, either....This will change. :-)

I figure, if I can run X, twm, about 6 xterms (each running a copy of bash), and a few copies of bash in other virtual consoles, all with only 4 Meg of memory, I can squeeze a few decent apps in there, too....

As far as a logging program is concerned, I haven't seen one (again, haven't been looking), but I've thought about writing up a simple database using index (I think it was posted to comp.sources.[something] a few years ago...check the archives). Should be really simple, and very effective. The only problem is, it wouldn't check for dupes, but a little hacking around with the code could probably solve that easily enough. With this, you could run index in one virtual console (or one xterm), while running your packet stuff, RTTY/AMTOR/PacTOR stuff, etc., in another VC/xterm.

If anyone asks, I could upload the source for index (and perhaps even a simple logging setup) to a local landline BBS, and folks could snarf it up from there. If someone asks, and I then upload this, I'll post something about it here, along with the phone numbers.

Btw, if anyone is interested, there will probably (eventually) be a host mode terminal program (KAMterm) for Kantronics TNCs under UNIX (Linux will be first, since that's what I run, but it should end up being portable). The only real concerns with this are the porting itself (which is progressing, slowly but surely), and the copyright issues, since KAMterm is shareware. I'd be interested to hear if people would be interested in this, but, umm, I wouldn't hold your breath...there are a lot of other things begging for my time, too, these days. :-)

>I'd also be interested to hear from anyone who is using a Unix box
>(any flavor) as a ham-shack computer.

Count me in. I haven't been too active lately, so there isn't much that the computer has been up to, but this is mainly due to the fact that I haven't ported KAMterm, I haven't downloaded KA9Q stuff yet, and I took

the mobile rig that was on packet and put it in the truck.

But before too long, I hope to have host mode (or KA9Q) up and running,
and will eventually get around to wiring up my old TR-2400 HT for packet.
Eventually..... (I've been planning to do this ``anytime now'' for
months.)

Later,

Amateur callsigns were, in earlier times, reissued. In the early sixties, when I received my first ticket, some of my contemporaries were pleasantly surprised to receive KN8xxx calls (novice calls carried an "N" second letter,dropped when upgraded), while I and others had our WN8xxx calls,later becoming WA8xxx. Many later "W" prefix 1x3 and others traded in their calls in the early '70's when, for a while, for a fee, an extra could request and get a reissue 1x2 call. Them days is gone forever. As I had commented in an earlier post, it seemed simpler to get custom calls and special event calls in the days of 3x5 cardfiles!

> someone who is looking to spend $1.50!

Well, the reason for this sort of behavior is that in all
Tandy-owned Radio Shacks, the employees work on commission rather than
an hourly salary. When I worked for them, they made it even worse by
staffing my store with ten employees instead of the six it should have
had. On any given week, only about three or four of the employees
would sell enough to have their commission clear minimum wage. What's
even worse, is that you have high incentives not to claim the hour
before the store opens or the hour before it closes on your time card,
since that lowers you dollar per hour. And it makes the salespeople
more aggressive than they should be, since they are competing against
each other.
All in all, the system really sucks. Of course, I did buy my
DX-440 with the 20% employee discount when it was on sale...

I second that endorsement. Very nice program. Just on a technical
note, it is not "public domain" - it is copyrighted; however, it is
freeware, so you can use it and distribute it for free.

I'm an international student holding F-1 visa.
Having operated as a memeber of club station HL0U,
I'm pretty familiar with HAM but since I came to US I ignored
about HAM because I thought US and Korea don't have reciprocal
operation agreement and since I'm not a US citizen, I presumed
I can't get a US liscnce. But very recently, I've heard otherwise.
I've heard many JAs go to Guam to get US liscnec since it's pretty
convenient at times. So I ask now, is it possible for a non-US
citizen, non-permanent resident to get a US liscence ?
If it's possible, I'll definitely pursue it ..

Thanks in advance

15 July 1993

Action in Docket Case PR Docket 92-136

"The Commission has amended the amateur service rules
in order to allow amateur operators more flexibility to
provide communications for public service projects as
well as to enhance the value of the amateur service in
satisfying personal communications needs."

Among the types of communications no longer restricted
by FCC rules and regulations are: collecting data
for the National Weather Service (aren't we doing
this already?!), facilitating events such as races
and parades (ditto), and making appointments and
ordering food. This is not a drill, it actually
says ordering food is no longer restricted.

So be the first on your repeater to order a pizza over
the autopatch, preferably for the next ham club meeting! :)

Note: Followups directed to .policy .

p.s. Thankfully, the Commission denied the ARRL's request
to provide a list of anecdotal expamples of prohibited
communications. Any time you ask a government for
a shopping list you are putting yourself in jeopardy
of restricting future interpretation of rules
and laws. I am glad that the FCC didn't have
the time or money to provide such a list.

>I called the next day and was told that the unit would cost over $400
>to repair! All the boards needed to be replaced except the logic board
>which was able to be repaired. One possible explanation given to me
>(after I explained to the technician how the radio died) was that it
>could have been caused by reverse polarity. From the battery packs?

I've had my problems with Icom also. Some years ago I ordered a 5.12 MHz crystal for my IC-02AT, which bit the dust after a respectable number of years. Got the crystal and installed it at work, where I did the troubleshooting (reason I mention that is that I had to open and close the radio every time I worked on it... you'll see more on this later). Nonworking radio. Nothing from the crystal.
Spent several days troubleshooting, trying to find out why a brand-new crystal wouldn't oscillate. Checked everything. Finally opened the radio one time too many and the flexy PC board between Tx and Rx boards cracked. At that point I knew I was dead in the water, so I pulled out the brand-new crystal and tried it in a microprocessor-based card made where I worked; DEAD NEW CRYSTAL.
Called Icom, spoke to someone, asked that they send a crystal and replace the flexy board they caused to become broken; they told me to send it to a particular person's attention and it would be fixed free, on a priority basis, as soon as it got in the door.
Packed it well, with a letter to the person reminding them they had promised priority repair for free.
Called them about eight days later; it was languishing on a shelf, it took the tech about ten minutes to find it, and he said he'd get to it the next day. I verified with him that the repair was to be free; he looked at the paperwork and said it was.
The radio arrived at my house about a week later... COD, seventy-eight dollars! The invoice contained all sorts of insults about my soldering technique (the board was immaculate; I started my _professional_ experience in electronics in 1967), etc. It made me regret having spent the time necessary to remove the flexy board and clean up the solder pads; I should have let that clown go through the trouble. Damn, I even de-fluxed it.
I gave the UPS man a check, stopped payment on it, and mailed Icom a letter giving my reasons and asking them for an explanation, even going so far as to suggest that I wouldn't mind bearing a part of the cost.
It's been a long time (four or five years?) and I have never heard

from them.
My new radio is an Alinco DJ180T.

5104. Re: How does an American sign in Canada?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-18 13:24:22 UTC
From: richw@mks.com
Message-ID: <1993Jul18.132422.9905@mks.com>
Source record: 278979

Earlier, I wrote:

Also, since an American or Canadian amateur operating
in the other country is required to obey both countries'
rules, . . .

to which Peter Laws replied:

I'm fairly certain that US law is completely irrelevant
when operating in Canada. And vice versa.

Sorry my previous comments were unclear. Here's why I made them:

An amateur operating under a US license is expected by the FCC to abide by US amateur regulations, no matter where in the world he/she happens to be located at the time.

Likewise, an amateur from another country, operating in the US, is expected by the FCC to abide by US amateur regulations, even though his/her license may have been issued by another country.

Similarly for Canada (and presumably for other countries).

Hence, an American ham operating in Canada must obey US amateur regulations (since he/she is licensed by the US), as well as Canadian amateur regulations (since he/she is operating on Canadian territory). Similarly for a Canadian ham operating in the US.

Now, in practice, it may well be that a violation of this principle will go unnoticed, owing to inadequate enforcement of amateur rules in the US or Canada. But my point was what the =rules= require; and for the moment, I still believe what I originally posted is correct.

Yes, it is. You must have a US mailing address and be able to read and
speak English well enough to pass the test and identify yourself on the
air. Sounds like you meet both of those requirements.

You also cannot be a representative of a foreign government. I don't know
why that requirement is there - a holdover from more jingoistic days?

About hams from other countries going to Guam - do they just get a post
office box somewhere on American soil and have their mail forwarded?

There has been much interest in this topic. So for the second time in my life, I have lovingly typed in this article from the Hints and Kinks section in QST.

From Hints and Kinks. Page 34 QST No Date.

If someone could supply a date. I and millions of silent nerds would be grateful.

ADDITIONAL BANDS FOR THE QUAGI

A number of amateurs have written the author inquiring about the use of the VHF quagi (QST for April 1977) on frequencies other than the three amateur bands for which dimensions were given (144, 220 and 432 MHz). Within the vhf spectrum, mathematically scaling the quagi to other frequencies is a relatively simple matter. To do so, take each dimension given for the amateur band nearest the desired frequency and apply this formula:

$$\text{New Dimension} = \frac{\text{original dimension} \times \text{original frequency}}{\text{new frequency}}$$

Thus, the driven element for the ATS-1 and ATS-3 weather satellites at 135.6 MHz would be computed as follows:

$$\text{DE } 135.6 = \frac{82 \times 144.5}{135.6} = 87.38 \text{ in } (2.22\text{m})$$

Each element length and interelement spacing dimension should be scaled to the new frequency using the same formula. Between about 100 and 500 MHz, this mathematical scaling procedure will produce and antenna delivering substantially the same performance as the original design. However the builder should bear in mind that a given element diameter "looks" three times as large at 432 MHz as at 144 MHz, for instance. Unless the diameter is reduced as the frequency increases, the element lengths must be adjusted accordingly. Example: When 1/8-inch rod is used for the director, the 432-MHz quagi requires directors fully 1/4-inch shorter than the mathematical scaling from 2 meters would suggest, and the dimensions given in QST included this correction.

In scaling a quagi to a frequency reasonably close to an amateur band, the calculation may be made from the nearby ham band and this variation in element diameter-to-length ratio may be ignored.

But for a frequency far removed form 144, 220 or 432 MHz, it would be best to calculate from amateur bands above and below the desired frequency and and then interpolate between the two sets of dimensions.

For frequencies significantly higher than 500 MHz or lower than 100 MHz, construction techniques would typically vary so much from the original design that the correct element lengths may be expected to deviate substantially from those mathematically derived. The best approach in such a case would be to experimentally determine the correct element lengths.

Wayne Overbeck, N6NB, Pepperdine University, Malibu, California 90265

Current address from March 1993 FCC records:

5112. Power lines in car for a mobile radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-18 18:53:44 UTC
From: fab4536@hertz.njit.edu
Message-ID: <1993Jul18.185344.16826@njitgw.njit.edu>
Source record: 278984

I'm about to install a 2 meter mobile radio in my '87 Cavalier. I'm having some problems finding a path for the power lines. What I want to do is to route two 10 gauge wires from under the dash directly to the car battery. I can't find any easily accessible openings in the firewall. Has anyone with the same type of car or same problem managed to find a solution? Any help would be appreciated.

In other words, Lasers.

I have an HP 5501A Laser , the one with the 3 electrode tube, HeNe type.

Where could I get the schematic for it?
I intend to try and modulate it,for experimental communications use.

I tried to inject audio via the kathode return ckt, using a resistor in
series, ie..like one would do screen grid modulation, then capacitor couple
that to a small audio amp.

It 'worked' (altho it would fry the 741 op amp after a while), and I could
hear audio using a photo cell-audio amp receiver, it seemed to be driving
the regulators nuts, causing the beam out-put to drop no matter how low I set
the audio level.
I figured this might be bad for the regulator, and in view of the now and
then burn out of 741's I put the project on hold.

Does anyone have any ideas?

Randy, KA1UNW

Source record: 278986

Greetings fellow hams:

I have just uploaded Bob Bruninga's (WB4APR) Automatic Packet
Reporting System (APRS) to UCSD.EDU incoming directory. The file
is named aprs114.zip, it contains the executable, readme files (docs) and
some demos that you can run to get an idea of the system and it's potential.
Basically the software displays a map that shows the postion of the reporting
stations. I really should say here that I am not doing this system justice
with my description. Back to the subject, the information that is passed
between the stations is via beacon, mail and other functions. It will be
very helpful with support for public functions (parades, races, emergencies
etc.) as well as fox hunting (it will coorelate beam headings from reporting
stations and triangulate the position for all to see who are running the software). Bob has
also included some features to use this system with GPS. Well
enough for the words, the best thing to do is download it and plug n' play.

SB DX @ ALLBBS $OPDX.120
Ohio/Penn DX Bulletin No. 120

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 120
BID: $OPDX.120
July 19, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, ARRL DX Bulletin, K4CEF & Southeastern Cluster Group, DF4RD, DK7ZB, AD1C, KA3DBN and W8GIO for the following DX information.

9G1AA CARDS. It was reported on one of the DX nets on August 13th, that a W2 down in Florida had recently made a trip to the Netherlands, and had visited several of the ops who put 9G1AA on the air. He reports they are presently waiting on the QSL cards. They have the labels prepared and they will bring them stateside for mailing some time in August.

BV9P, PRATAS. Rumor is circulating that the Pratas trip has now been delayed until August and that Martti, OH2BH, has agreed to join the operators there.

KA3KJH/S0, WESTERN SAHARA. Back on May 25, 1993, OPDX published (OPDX.104) comments by Arseli Echeguren Bardeci, EA2JG (R.A.S.D Manager), stating KA3KJH was operating without permission and was not operating within the S0 territory. This week OPDX received two letters from Gerry, KA3KJH, (which was forwarded by Paul, W8GIO) refuting the allegations by EA2JG. Gerry states he is in Western Sahara as a United Nations military observer monitoring the cease fire between the Frente Polisario military and Royal Moroccan Army. His location is at Agwanit (the UN Teamsite), in the southeast of Western Sahara. Gerry states he has been there since February and will remain until August. Upon his arrival, Gerry requested authorization to operate an amateur station from this location. As there is no standing civil authority in this region, Gerry worked with the military commander of the Frente Polisario there and requested the use of the call KA3KJH/S0. Gerry only presumed this was coordinated with the Polisario government in exile in Algeria, as there was a brief delay before his operations was approved. Also, Gerry has met with S01MZ, Director of Communications, and has enjoyed tea and pleasant conversation with him, without any questionable references about his operation. This, Gerry feels, assures that his call sign

and operations are legitimate. Gerry indicated that EA2JG has not contacted him directly, nor has any other individuals or groups, with regards about his operations. All materials for accreditation will go to the ARRL after his return to the USA in August.

KH3, JOHNSTON ISLAND. Two stations were active this past week from here, KH3/N5HX and KH3/NH6D. Activity was on 15 and 20 meter CW around 0130z and 1030z.

OH0, ALAND ISLANDS. Martin ("MART"), DK7ZB, will be active as OH0/DK7ZB from July 25th to Aug 20th. Activity will be on CW only and on all bands 6-160 meters, especially on the WARC bands. Martin should have a great signal using a 3 element beam on 10/12/15 meters, a 2 element beam on 17/20 meters, a Delta-Loop on 30/40 meters and a Double-Zepp on 80/160 meters. PLEASE only QSL via the Bureau.

PY0, TRINDADE & MARTIN VAZ ISLANDS. Rolf, PY1RO, will operate from Trindade for about 5 days starting about July 28th. He will operate mainly CW on 10-160 meters, including the WARC bands (less 10 MHz, because no legal privileges in Brazil). For the IOTA chasers, Rolf may operate from Martin Vaz Island for a short period during those 5 days (This has never been activated!). Rolf will make an announcement if the possibility arises to be active from Martin Vaz (For DXCC this counts the same as Trindade). The call signs are not known yet, but QSLs will go to: Rolf Rasp, P.O. Box 51, Rio de Janeiro, RJ, 20000-970, Brazil.

VP2, ANGUILLA. NODXA member John, KA3DBN, will be active as VP2EBN from August 22-30. Activity will be on 80-6 meters, CW, SSB, and RTTY. He plans to concentrate on 18, 24 and 10 MHz CW. John also plans to be active from St. Maartin for a few days towards the end of his stay. QSL via Bureau or direct to his CBA.

VS6, HONG KONG. Martti Laine, OH2BH, will soon be moving to Hong Kong and he will be there for the next 2 years. We may expect a big-time signal out of VS6 and perhaps some additional good Far East DXpeditions. Martti will be a regional sales manager for a Finnish Cellular Telephone company. His territory will include BV, BY, VS6/VR2, DU, HL and P5!

ZS8, MARION ISLAND. ZS8MI continues to be active on 14195 between 1000Z and 1400Z on longpath. He has also been reported on 14247 and 21205. Christie also reports he will start some CW operation in August.

DXAC HAPPENINGS. Here are the results of two DXAC votes that were announced July 12th: 1) The DXAC voted 6 yes and 10 no on the question of adding band or mode-specific Honor Rolls to the DXCC program. Those voting against the proposal were concerned about a proliferation of awards. 2) The DXAC voted unanimously against a proposal that would have changed the Countries List Criteria Point 2, Separation by Water. Under the failed proposal, distances would have changed from 225 2(a) and 500-mile 2(b) separations to 100 miles 2(a) and 100 miles 2(b). Committee members felt there was insufficient support for the proposed change.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

>are doing nothing. We should take that active approach rather than take
>the approach "if you don't let me put up my antennas, I'll take my ball and
>go home and then you won't be able to play". When people see our value,
>and they generally don't, the restrictions will ease.

Being as how I'm the one who threw the first gauntlet about ignoring the communities who don't want us around unless they desperately need us, I'd like to address this. Here in Schiller Park IL, where there are numerous tri-band HF beams on top of houses and on small towers, I've taken the initiative to start researching what it would take to get an ESDA off the ground (one has been authorized since 1982, but nothing was done about it). I've been working with the police and with the village personnel to get things in motion, and slowly but surely it's happening.
If this were the kind of community that restricted amateur radio in any way, I wouldn't even bother; there are numerous communities around this area who don't restrict hams, and in case of emergency I'd be scrambling to one of them to help them out (after taking care of my own family, of course). Furthermore, I'd be doing everything I could to subvert the existence of cable in the area, the ultimate goal being to force the residents to reconsider as they watched snowy, ghosty pictures from their rabbit-ear antennas (attic antennas may be better, but still not good, especially with the number of houses built with aluminum-covered insulation these days; if your house doesn't have it, chances are someone in your path does). And I'd be poring over the restrictions to see if they forgot to include an exception for their police/fire/city works towers, too.
(Lest you think money would stop me, my current employment outlook and income would place me well within the bounds of being able to sue for free.)
But through all this, my main point is that if they don't want me around until they can use me, chew me up for a while then spit me out again until the next time, they won't see me around when the chipped beef on toast hits the fan. My feeling is that, if they feel they can get the help when they need it without having to let me practice my art, they'll feel no need to change the status quo; if they suffer a bit for lack of manpower and resources, maybe they'll think about it a little bit.
Selfish? Yes. Crude? Yes. But I live by a credo that says I'll bend over backwards to help those who help me, but I'll go out of my way to avoid helping anyone who tries to impede me.

5128. Re: impatient newbie ham

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 01:55:05 UTC
From: wtm@uhura.neoucom.edu
Message-ID: <1993Jul19.015505.7817@uhura.neoucom.edu>
Source record: 278997

I upgraded my ticket from tech/HF to advanced on May 8. I
received my new FCC license on July 8. That is substantailly
better than when I took my first exam last September; that time was
about 13 (!!) weeks.

How long it takes to recieve your license depends upon the
efficeincy of the local VE team and the VEC. Almost two weeks may
elapse before the paperwork reaches Gettysburg for processing,
especially if a federal holdiay is thrown in. My
understanding is that the forms are processed on Tuesday and mailed
on Thursday. The date of issue on my latest license is July 6.
That is pretty impressive that it arrived on July 8. I suppose it
could have made it here to Ohio the same day it left Pennsylvania,
but that seems unlikely. Occasionally, it appears, the wheels of
the federal government don't turn all that slowly.

73,
Bill

Contact your GM/chevy dealer. They should have literature
outlining recommended mobile transceiver installation practices.
GM seems to be at the Dayton Hamvention with a display every year.
I picked up some notes there that had general helpful hints. More
than likely, there is a bulletin for your specific car.

How does the mobile 12V unit interface into the FT-23R? Is it 12V into the
mini plug on the battery, or does it attach to the 12V clips on the bottem.

--
=-=-=-

5131. Correction: PA-6 to FT-23R

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 02:59:12 UTC
From: pachner@csd4.csd.uwm.edu

I just wanted to pass along some helpful advice after reading Russell's story about his Icom W2A. Fortunatly his story had a happy ending, but it doesn't always work aout that way for all of us.

I have been saved several times by my buyers protection on my credit card. I have a Citibank credit card but there are several that off this protection. It will double the manufacturers warranty on things you buy with the card. (In fact Citibank just started a lifetime warranty policy) So I buy all my new equipment with this card and they pay the repair bill if anything happens to it durring the covered period.

I am not endorsing any card in particular. I'm just letting people know of a great insurance policy that is nearly free (annual membership fee).

5133. Super Morse problem in Windows

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 04:48:55 UTC
From: david@bu.edu
Message-ID: <22d93n$khj@news.bu.edu>
Source record: 279002

I am having a bit of difficulty with the Super Morse program. It works fine when I run it directly from DOS, but if I try and call it from within Windows or in a DOS shell under Windows, I end up with the dits sounding like clicks instead of tones, and the dahs sounding like proper tones.

Again, I have no such problem when running without Windows. Anyone seen this problem or have a solution? I'd like to be able to do some short sessions while waiting for other stuff to run and I hate to have to exit Windows in order to run Super Morse. Any help will be appreciated.

I lost my FT23 long time ago, so I have a vague memory, plus I only have
alkaline holders (and I still! AA and AAA). I think the external DC has to
be to the same place a battery attached at the bottom, so you have to
slide out the battery. Do not plug 12V DC into a 7.2V NICD, if it only
says "charge", because it will give too much Voltage to the battery.

Actually, I wasn't aware of this. However, I agree with it. Well, I'm not sure it is prudent for someone to use the autopatch for ordering food, but, oh well.
Just the other day I got myself into a situation where I had to use the ap to call our local transit authority. I was unsure about it but I was overheating and all and if nothing else it is an emergency communication. Does this new ruling mean it is ok for me to do this?
Btw, I'm a blind person who uses the bus system all the time and had gotten myself into a bind and had to get sked information for the bus. I was unable to locate a telephone. 73 de nu7i

|>

-- A representitive from ARRL came to a DARA (Dayton Amature Radio Association) just before HamVention. One of the questions asked of him was about the Public Relation firm ARRL hired, what had they done. He told us that a lot of good PR articls were out and had been published. I took on the challange and searched for some of this PR. I found very little in the major newspapers, I have access to search several from around the country. I then searched newspapers, using Ham Radio, Amature Radio, ARRL(even spelled out ARRL) from 1990 to present, only a few articles were locate
stly to anounce classes or tests. Of course our colleagues in former Yugoslavia have received great PR for their work. I can
remember the news of the Alaska earthquake was first relayed by Amature Radio, they were heros and a Postage Stamp was even issued in their honor. ARRL needs to get that PR firm moving, get the word out, Amature Radio should not be considerd a nuisance.

(.sig's deleted to save space)

The ARRL representative that night was Allan Severson, AB8P, the Great Lakes Division director. The reason I asked him that question (yes, folks, it was nice little old me raising the ruckus) was that my limited experience was the same: namely, that I had yet to see any results from the work done by the firm ARRL had placed on retainer. In a private e-mail, a ARRL section manager who frequents this group essentially confirmed what AB8P had said and added that at least in his area, the PR firm had provided some good stories. In accordance with netiquette, I'll let that SM reveal himself and/or amplify his remarks if he so desires.

I am still left with my original concern: IMHO, the purpose of the ARRL and its PR firm should be to coordinate *national-level* publicity. Local PR should be handled by local clubs and ARRL PIO's. This, of course, requires local clubs to get off dead center and do some work. Depressingly, though, I think this is another area where W2NSD/1 is correct...most clubs don't give a rodent's hindquarters about doing this kind of work.

Reasonably long-term readers of this group may remember my surprise last year at seeing absolutely no mention of Hamvention in the multitude of Dayton-area promotional brochures I received from several real estate agents prior to my arrival. Lo and behold, I picked up the latest issue of the Dayton rag published to attract tourists and conventions and saw a listing for the Hamvention, so at least locally we're making some progress. On an unrelated note, last week's issue of the Huber Heights (Dayton suburb, for the Miami Valley-impaired) "Courier" had a front page story with pictures on the work that Nelson (WB8VUU) and Paula (KA8HQJ) DiGennaro are doing with Skywarn. I doubt that the ARRL or its PR firm know (or even should know) about this story -- but maybe I'll sned them a copy for the League files.

The bottom line is this: what can the ARRL do to improve the general public's image of Amateur Radio? What *should* the League do? More importantly, what can *you* do?

5142. NEW VERSION OF MORSETRAINER FOR MAC AVAILABLE (1.0.3)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 12:22:16 UTC
From: Lars Sundstroem <sund@tde.lth.se>
Message-ID: <22e3lo$n8j@nic.lth.se>
Source record: 279015

MorseTrainer 1.0.3

Available now via anonymous ftp at 130.235.32.86

morsetrainer-US-1.0.3.hqx (US version)
morsetraening-S-1.0.3.hqx (Swedish version)

MorseTrainer 1.0.3 is a new-features and bug-fix release:

1.
The tempo and speed settings can be given as words per minute or as before
characters per minute by using a poupmenu.
2.
Monaco 12 is used to represent the text to be signalled. The problem with
this
font is that O (the letter) and 0 (zero) can't be distinguished from each
other.
However, this is not the case for the TrueType version of Monaco 12.
Therefore,
if TrueType is available it will be used instead of bitmapped fonts.
3.
A number of small bugs have been fixed.

MorseTrainer is a powerful tool for learning and training Morse code.

Features

* Three different training modes: user text, random text, library text
* Arbitrary signal pitch and timbre
* Arbitrary speed and tempo
* Multi-alphabet support
* Random text generator
* Text library editor
* On-line alphabet
* On-line manual
* Help Balloons
* And a lot more!

And of course, it's FREEWARE!

It's no problem at all! As long as you have a U.S. address, you can
get yourself a U.S. licence. I used my uncle's address in Detroit. Of course,
you WILL have to sit for the examinations. But if you've been a ham for a
while, it should be no problem; it IS a multiple-guess format exam :-)

Does anybody here have a dog?

Have you ever been saying something, or listening to something, and you
see the dog cock its head to one side or the other? Imagine what it
would be like if you had these REALLY high-gain ears, like dogs do,
and had to pick something out of the noise?

Dogs have been tilting their heads to hear better for a long time. It's
not that they're confused about something, or trying to understand
you better - they're just trying to hear better.

Scott NF3I See, we're not so advanced after all. Imagine if you could
teach a dog Morse Code. Of course, getting him/her to WRITE
down what was sent could be a little tough...

5147. TS50 Illegal!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 13:22:48 UTC
From: levine@mc.com
Message-ID: <22e778$t15@jericho.mc.com>
Source record: 279018

The lead article in this week's W5YI Report is the story of several Ham Radio retailers (like HRO) who were fined $7000 for selling the TS50 because it can transmit out of the Ham bands right out of the box and it isn't type accepted for those frequencies. The article also specifically mentioned the FT530 HT which can also transmit out of the Ham bands right out of the box (140.000 - 150.000)

If it is illegal to sell these radios, then is it illegal to use them? Is it legal to use a radio which is type accepted for a part of the spectrum it covers, but not the entire spectrum it covers?

Bob

Krishna,

I see no reason to change your name at all! It is a fine and honorable name,
indeed. :-).

If you would like to shorten it for CW, Kris should work just fine. After
all, hams who talk all over the world do become accustomed to names
other than "Bill" and "George."

I have had a lot of folks not be able to copy "Ed", so I suspect that
part of the problem is not the difficulty of your name. Of course, if
I am running my usual power (10 milliwatts), people have trouble with
EVERYTHING I send. :-).

I wonder how he sent it. My dad, W9BRD, has a wonderful
two-finger (and two-handed) method of sending with a straight key
that's darned fast. (I can do it, too; it pays to be interested
in percussion.) Dunno what my/our max speed is. It's quite
distinctive, though: My dad used that technique to qualify for
the 2nd-Class Commercial radiotelegraph license just after WWII.
It raised eyebrows at the Chicago FCC office. When my dad took
his Extra exam in the late 1960s, he used the same two-finger
technique and *the same examiner* heard it, leaned out of his
office and said "It's *him*!"

Incidentally, Chuck, my dad, who copied slip for a spell at WAR
during WWII, is certified at 55 WPM, and I see you're at 60 --
FB. *My* brain typing/copying "machine" doesn't mesh anywhere
that well!

Well, this is interesting. I have owned numerous transmitters and
transceivers through the years, and every single one of them had
the capability of transmitting outside of the amateur bands. None
of these have ever been declared illegal to my knowledge. At the
moment, I own a TS930, an IC720A and a TR3, and each of them will
transmit outside of the amateur bands. Same deal with our TS440
here at our club station at work. Why should a distributor be
penalized because a manufacturer designs and builds "improperly"
designed equipment. Didn't the FCC approve the equipment for sale
here in the U.S. anyway? What is going on here? What's wrong with
this picture? Seems kind of fishy that Kenwood would come out with
what appears to be one of the greatest advances in HF transceiver
technology - an ultra-compact full function HF transciever, handily
beating Yaesu, Icom and Ten-Tec to the market, and all of a sudden
the TS-50 is "illegal"? Hmmmmm...very strange indeed.

Source record: 278932

IC-730 RF Problem

>i am currently using an Icom 730 with a Pyramid Power Supply (12-15v @ 25A)
>and feeding the rig with a random wire thrown out of my bedroom window.
>The problem that I am having is that on 40m and 20m, i cannot get the rig
>to put out 100w. The tuner has a built in SWR/Power meter and I can get
>the SWR below 2:1, but I can't seem to get more than 50w output.

Regardless of what the SWR meter says, the load the rig is seeing is quite reactive, and the rig simply refuses to destroy itself trying to deliver power to that load! How long is the cable from the tuner to the rig? Sometimes that length can be a problem. If you have something else to try in there that is a different length I'd try it. No matter how hard you try you cannot make the reactive component of the load absorb energy! But you might destroy your rig trying! Fortunately, your rig is apparently working properly and protecting itself. Be careful.

You didn't mention the tuner but it may not be able to deal with the reactance and high impedance that your end-fed wire presents. Does the rig measure SWR on its meter? I can't remember, but I think it does. If so, tune the tuner to reduce the SWR indicated at the radio, not the tuner and give that a try. If you can, add some length to the wire; at least 8', and see what happens (but be careful!).

Your situation is another example of attempting to get the tuner (whatever that is) to do something it probably was never intended for. In spite of popular ham opinion, it is likely that your tuner simply cannot handle the load you are asking it to deal with. NO TUNER MADE BY MAN can really "load a bedspring" as some hams believe! You could probably build one, but none of the popular tuners can actually do it, contrary to what you may have been told by unknowing "elmers". All tuners have a designed in range of load impedances and reactive components that they can really deal with effectively. It is very likely that your end-fed wire is well beyond the capability of your tuner! Changing it's length may help on one band, and make it worse on another, so beware!

Your wire is probably 2000-8000 ohms on some bands. Considerably less on a band that the wire is odd multiples of a quarter-wave long. The typical tuner of today will handle 300-500 ohms max, within a limited range of reactance to boot. They will simply NOT TUNE ANYTHING as you may have been told! That is quite simply NOT TRUE! It is another example of popular ham lore that perpetuates bullfarb, ad infinitum.

>Sometimes,
>however I have been able to crank out all of the 100w. To make matters
>worse, under some circumstances, I can get a perfect 1:1 match with about

^^^^^^^^^^^^^^^^^

Tells you something about what the SWR meter is capable of, doesn't it?
Apparently at the low power levels the REVERSE power sensitivity is too
low to read properly, and what you think is 1:1 is quite something else!
Generally speaking, most bridges are 10db or more less sensitive in REV
than they are in forward.

>10w output, but when i turn up the juice, the rig immediately turns off
>when i key the transmitter. I've noticed that the power supply shuts off
>when i hold down the key.

It's quite possible you could be getting quite a bit of RF into the
power supply as well. I had a problem like that with a different piece
of equipment, but it was somewhat similar to what you see happen.

>so now for the question......what's going on??????!?!?!?!?!?

Some of these popular mis-conceptions are dangerous, as you have found
out. Be thankful that your rig still works, as it could have very
easily gone up in smoke if it wasn't trying so hard to protect itself
from you! Hi!

>oh, yeah, one more important point....I am 30 ft off the ground and the only
>ground I use is the DC wall ground and a counterpoise as an artificial RF
>ground.

I wouldn't even bother with the wall ground!

>any suggestion on how to cure this?!?! I would like to run all of 100w
>because those contesters can get quite impatient with my S1 signal.

Good luck, and watch out for the RF burns!

> ^^
Really? Marc, wonder how you managed to determine this?
Did you measure it, or was this your perception?
If perception, wonder what bands it was based on?

Can you really tell the difference between -135dbm and -133dbm?
I suspect that it was something other than a lack of sensitivity that
left you with that perception.

Do you realize that sensitivity is really not terribly important these
days, as they (the vendors of amateur equipment) have not made a radio
in the last 20 years that was NOT SENSITIVE ENOUGH for the HF range!
Actually, too much gain, or a poor gain distribution, what many hams
would call a "really hot receiver", usually suffers from severe lack
of performance in much more important areas with today's crowded ham
bands in mind.

In fact, most of them are far more sensitive than they NEED to be for
use on the amateur bands below 30mhz! A .5uv for 10db spec is more
than adequate for any normal HF activity, unless that includes using
low gain receiving antennas (like a beverage) without a preamp for
example.

> features one expects on a receiver are not available (notch, if shift).

Like Fred's, my TS-50 DOES have IF shift! ^^^^^^^^
I believe all the TS-50's made by Kenwood do have it as well.

Most "notch" filters I've ever used are too damn tedious to adjust
anyway, and for that reason I seldom ever use one if it is available.
Not only that, if its IF-based, it screws up the bandwidth so bad
it really makes the signal difficult to understand, and hard to listen
too. More trouble than its worth most of the time, unless you're
trying to operate within several khz of an AM station, they're next
to useless for me.

> For my money, I'd sacrifice size and get an Yeasu FT-890. This rig has a
> great receiver, built in tuner & keyer, and, with the tuner, costs less
^^^^^^^^^^^^^^
I would agree with your assesment that the FT-890 does offer alot for

the money, and every one I have heard on the air sounds very good on SSB. The size, for me, was a deciding factor however, and apparently Fred as well. The radio has not been disappointing in performance either, so I made a good deal; for me. After all, that's why they make chocolate and vanilla. What's right for you may not be for me. Obviously, for you, the size difference was not as important a consideration. So you got a good deal too, and thats terrific. But all that doesn't make one radio BETTER than another, because we all bring a yardstick of different length to make the measurement by. What's better for me, may not be better for you or Fred, and its as simple as that.

Hmmm!? What is it for you that makes a "great receiver"? I would be really interested to hear. Personally, I've only owned one (1) in over 27 years as a ham; and that was the FT-1000D. Lots of "good ones" and a few were excellent, but only one "great" one.

> than the TD-50 with the tuner.
>
>Marc-

>>Although I agree with your assessment of the FT-890, I still prefer the
>>TS-50. While the Yaesu offers a lot for the money, I find it more
>>difficult to use.

>>I haven't had any complaint about TS-50 sensitivity. Even on Ten Meters,
>>the atmospheric noise is stronger than any internally generated noise. It
^^
Absolutely!
And as long as thats the case, the radio is MORE than sensitive enough!
Precisely!

>>does have a "Scotch" S-Meter. I can understand signals on Ten Meters, that
>>don't even register on the meter.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Good point Fred!

Don't know what "Scotch" S-meter means for sure, but S-meter activity or response has NOTHING at all to do with sensitivity! If the S-meter was absolutely accurate, 1uv would register S3. So it's a safe bet that the signals Fred was hearing were considerably less than 1uv!

Altho' S-9 is supposed to be -73dbm (50uv), band-to-band gain variations in most equipment render it useless as an absolute indicator. For example, 50uv may read S-9 on a particular radio at 14mhz, but the same level will often read S-9+30 on 3.9mhz! In this case the band-to-band gain has changed by 30db! Does that mean the radio is more SENSITIVE on 3.9? Absolutely not! It means the radio has an excess GAIN on 3.9, and thats all. A slow or low reading S-meter DOES NOT MEAN A RADIO IS NOT SENSITIVE ENOUGH! It may mean the radio is down some on GAIN on a particular band, but it doesn't mean its not sensitive! With the current crop of small radios it would not be surprising to

find one or the other lacked some GAIN on a particular band, as one way to make them smaller is to simply not have as many IF stages.

That impact can be significant as it means the design must recover the gain lost by not having enough stages, and they then attempt to make up the loss by requiring the mixer stages to provide much more conversion gain than they otherwise would. This compromise usually means the radio suffers from other performance maladies, but very few could be said to be not sensitive enough.

What does the typical spec for sensitivity mean then? What does .25uv for 10db S/N actually mean? What it says is this: A signal level of .25uv (or less) will generate an increase of (at least) 10db at the radio's output. And it better, as you'll see!

As such, it is more a spec of GAIN, not sensitivity! The reason is that .25uv is well above the radio's MDS (typically -135dbm)! Note that .25uv (-118dbm), is 17db or so ABOVE the radio's MDS (minimum discernable signal level, or noise floor) to start with. This is precisely why the spec usually says "at least 10db" or ".25uv or less" will produce the rated increase in output. The rigs we use these days usually have a noise floor of between -134 to -141dbm, (note that .1uv is -128dbm!), so its easy to see that they offer quite a bit of excess sensitivity in most cases. It also makes other properties of the receiver much more important when making comparisons of equipment, because they're already plenty sensitive enough, as Fred said above!

The noise floor of a receiver establishes the MDS (minimum discernable signal level), and thus the ABSOLUTE MINIMUM signal that can be detected by the radio. This MAY be what Marc observed (above) that gave him the impression the radio was less sensitive than it should be. It's also why I asked what band he observed this on, as it may indicate a problem somewhere else (like synthesizer) that might raise the noise floor on a particular band and ruin the radio's performance. However, its not very likely that he was attempting to listen to a signal at, or very near the noise floor of the radio 'cause as Fred said, the atmospheric noise is well above that on any and all HF ham bands anyway.

>>My TS-50 does have IF Shift, located on the same shaft as the RIT control.
>>The bigger rigs have very few features that I miss on the TS-50. I seldom
^^

Ditto! Bells-and-whistle's, as they've come to be called! And I, like Fred, truly find many of them to be just that; bells-and-whistles are things we don't need, or use very often anyway! What's a shame about this is that you get'em on most equipment whether you want'em or not! I'd rather see them spend more money on improving basic radio performance, instead of all the damn "B&W's"!

>>use the notch filter, XIT or speech processor on my other rig. I really
>>appreciate the LCD display that can be read in direct sunlight. Being able

>>to set up four functions to be controlled from the buttons on the
>>microphone, is quite handy when mobile. ^^^^^^^^^^^^^^
^^^^^^^^^^
Yes, I do like this feature, but one is tragically missing for me! You
can't (or is it that I haven't figured out how to do it yet?), have a
button select modes like I want it to. You can select, and then bounce
between AM-FM, for example, BUT YOU CAN'T THEN GO BACK TO USB-LSB-CW
WITHOUT pushing the darn little button on the radio itself! This one
really ticks me off, 'cause I use the radio often for SW listening,
which is of course, AM. But once I've done that I can't go back to
SSB or CW without hitting that damn little button on the radio, which
is hard to find, kinda close to the tuning knob too! !#$%^!!^&)

>>However, it is only a matter of time until the other manufacturers match
>>the TS-50. A transceiver even smaller than the FT-890 would be neat, if it
>>had a built-in tuner.

5163. skeds for Persieds meteor shower

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 16:01:14 UTC
From: cbetz@radioman.cray.com
Message-ID: <1993Jul19.110114.17885@walter.cray.com>
Source record: 278942

I may be jumping the gun just a bit, but I'm looking for anyone interested in running 144 or 222 Mhz schedules during the Perseids meteor shower next month (August 10-12).

I'm mostly concentrating on 2m, but plan to run a few 222 skeds. I'm especially looking for 2m skeds to NH, VT, RI, WV, NC, ID, WY and NM.

I'm located in grid square EN44 in Wisconsin.

If anyone is interested in a sked, please email me. Thanks.

Charlie Betz N0AKC
cbetz@romulus.cray.com

5164. DJ-580 question

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 16:06:19 UTC
From: jeffh@ludwig.cc.uoregon.edu
Message-ID: <22egpr$6vh@pith.uoregon.edu>
Source record: 278936

I originally posted this to rec.radio.amateur.space and didn't get much response so I'll try here...

Last year there was an article in the "hamsats" column of 73 magazine about working rudak-2 with the dj-580. I have done some experimenting with mine and am wondering if it has a problem. First of all, I would obviously need a linear for the 70cm side. The problem I see is on 70cm transmit the 2mtr side is desensed. How can you hear the downlink with a desensed receive side? It appears that the FM signal is not affected by doppler near as bad as SSB (bandwidth?) So maybe you don't need to monitor the downlink? The author of the article (Andy, WA5ZIB) mentioned using headphones to eliminate feedback, so it seems to me he was monitoring the downlink on transmit. Any insights on this from other 580 owners would be appreciated.

So the basic question I'm asking is should the 2mtr side desense when transmitting on 70cm?

Thanks,

In rec.radio.amateur.misc, clifto@indep1.UUCP (Cliff Sharp) writes:

[deletions]

> I think you've got it there. Speed is proportional to the time spent
>trying to get your speed up.

Well, maybe. It's too bad from a pure knowledge point of view that CW is no longer the important factor in radio commerce as it once was -- from the standpoint that just as we're coming out of the Dark Ages about how people actually do (or do not) *read*, we also could be getting close to moving from BC to AD on how people actually do (or do not) learn to copy Morse at whatever speed.

People are now knowing that relative inability to read is not *necessarily* lack of initiative or practice; reading is a very complex feat for an organism to perform. *Many* factors come into play in the action of reading -- "attention span," psychomotor, psychooptic and many other issues -- and this means that many factors can get in the way of/contribute to reading maximally.

Characterizations of Morse code as a *language* notwithstanding -- it isn't; at its base, it's mainly an aural means of representing an extant *alphabet* (yes, I know about Q signals, and the fact that some operators hear entire words/phrases as "single sounds") -- whatever Morse code "machine" we construct in our heads can more or less be considered as a "converter" or "front end" for *extant reading skills.* This "conversion" is really tricky -- it involves psychomotor and psychoacoustic issues *entirely absent in reading the printed word.* We can therefore expect that reading research will not translate directly to understanding how people learn to understand Morse.

Even if you're capable of "converting" the sounds properly into letters and/or words, what then? If you can't read -- that is, if you can't get meaning out of particularly arranged words which are themselves made of particular arrangements of letters -- you will probably be a failure at Morse. (At this point it's useful to add that people are likely to differ in whether they can copy "in their heads" or write and read it. And writing it down versus head-copying is yet another forking path, as is typing versus handwriting. Generalizations fail because every person pushing his or her limits is a special case.)

Cutting to the chase, I'm (at least intellectually) saddened by procrustean approaches to Morse code learning and speed

improvement, just as I'm (actually) saddened by such approaches to the teaching of reading or analyses of the relative inability to read. Whenever you come across "*Everybody* can do it if they just concentrate/try/pay attention/whatever" statements, you are perceiving an approach from the Dark Ages of education. Everybody *can't* read at exactly the same level, much less get to whatever level they get to in exactly the same way. Everybody *can't* learn to recognize, understand and send the Morse code at the same speed, much less get to whatever level they get to in exactly the same way.

Whatever the activity, reportage about it tends to emanate from its converts, enthusiasts, and adepts -- especially true of avocations. We tend *not* to hear from an activity's more prosaic practitioners or those who have fallen by the way. Yet, enthusiasts and adepts operating outside of the scientific method may not be very good at prescribing sound means for nonenthusiasts and nonadepts to *become* enthusiasts and adepts. (In many cases, they got where *they* are *without* programs like the ones they devise!) This, I'm afraid, may operate in avocational Morse code instruction.

5166. Lightning Bolt Quad Review

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 16:13:59 UTC
From: JMG@tntech.EDU
Message-ID: <01H0Q3HCMKCEAH2S9U@tntech.edu>
Source record: 278935

Lightning Strikes

Review of the Lightning Bolt 5 band, 2 element cubical quad:

Gain: 8db
F. to B. 26
Side Lobe 50
Boom diam. 2"
Turning radius 10.6'
Weight 25lbs
Arm Length 13"4"

Actual SWR measure after installation using given assembly measurements:

10 Meters: 28.000 2.0:1
28.200 1.7:1
28.300 1.5:1
28.500 1.12:1
28.700 1:1
29.000 1.2:1
29.700 1.6:1

12 Meters: 1.5:1 or better

15 Meters better than 1.4:1

17 Meters 1.5: or better

20 Meters: 14.000 1:1
14.100 better than 1.2:1
14.350 1.2:1

* I just did what the instructions said and did no tuning (yet)

The Saga Begins:

I really wanted a directional antenna. All the work involved scared me.
I saved for a while and went to the big Hamfest in Huntsville, Al. This was
my first big ham fest. I had enough money to buy a two element 3 band Yagi.
I would then save for the tower and the rotor. I went to the hamfest and hung
around the antenna booths asking a lot of questions. I came across the Gap
booth and there seemed to be a bunch of people who had previously
purchased a Gap Vertical and were very happy with their purchase. My elmer
has been using the Gap with very good results for a long time. I ended up
spending my money on a Gap. The Gap was very easy to assemble and put
up and I have used it for two years.

I really love QRP and was getting the directional antenna bug again. A friend has a quad and I think they are really nice looking and have heard him up against a local Mosley tri-bander chasing DX. The quad seemed to get through a lot better. About a year ago I sent for the literature on the Lightning Bolt five band two element quad. I read a lot about the pros and cons of quads versus yagis and decided on a quad. The work involved and the cost kept me back.

Progress
A friend offered me 30 foot of tower that matched 30 foot of tower that held my TV antenna, this was the first sign that I needed to take some action. The second sign was that my TV antenna was about dead. The third sign was the article in CQ magazine saying the Lightning Bolt really worked well.

I took the old TV antenna down from the tower and mounted a new one on my roof attached to the chimney. Had loads of fun with wrong parts and such. This freed up my tower. The only problem was that I had very large trees all around the tower. I got out my chain saw and tuned it up. I ended up having to take down seven trees that were all 70 foot or bigger. Luckily a new ham friend happened by with his pickup and helped out. Instead of cutting up the trees, we hooked them to the truck and pulled them into some acreage I don't use.

I then had to pull the top of the tower off and added an extra 10 foot section and put the top section back on . This turned into quite a project. This was bested by putting up of the 21 foot section of thick walled steel pipe. I think anyone who puts up a tower needs to find a friend with a Cherry Picker. Without any special devices except for a climbing belt and rope, we managed to drop the mast down through the middle and back thru the appropriate support.

Building the Antenna

All of this was taking place over a month and a half period. My antenna had arrived about three weeks after cutting down the trees. The intsructions were only a few pages long. There was only one unclear part in all the instructions. This involved the tuning stubs for the reflector element. There is a section that describes an eight inch variable stub and then the next section gives exact measurements for the stubs for each of the 5 bands. I chose to use the specified measurements and didn't figure I wanted to mess with this antenna if in fact I ever got it all assembled.

I took my time building it. I assembled the spider parts one night then built the reflector then the driven element. You only need to be careful with the wire. It likes to coil back up and could really get you hurt if you let go of it. We were pretty carefull cutting the wire which was a little hard because of the type of wire, but nothing to worry about. It is really pretty easy to put together and very light.

Finished

Well we finally got everything built and I wanted to see the antenna work. The temperature was about 99 degrees and much hotter on the roof. It took about 5 hours in the hot sun getting the elements on the boom and the

rotor working right.

I went into the house very nervously. I took out my MFJ digital antenna analyzer and hooked it to the antenna. I let out a big sigh of relief and went outside yelling and screaming. My friend who was helping me was still strapped to the top of my tower and was very relieved to hear the good news.

On the Air

We were both pretty heat sick at this point, and drenched. I turned on the radio and actually plugged in a microphone, something I hadn't done in a while. I worked VP5M in the Caicos Isands on 15 meters, then I8UDM first call thru a pileup on 17 meters, CT1GG/CU3 first call to the Azores on 17 meters.

I hooked up an antenna switch and went back and forth between my Gap and the Quad. the Gap would read 51 and the quad would read 57 to 59. In some cases I couldn't even hear the station on the Gap and he would be nice and strong on the quad.

The Real Test

WS4S, the only other QRPer in town came over the same evening to help work on a friend's tube rig. He had to play with the new antenna before we started on the rig. The first thing he did was turn the power on the rig down to 1 watt and worked 4X1EL, after which I worked him also.

He was grinning and getting ready for some serious experimenting. He turned the power down to 20 MW and wokred Z36CXN in Macedonia. I really wanted the same station, so I cheated and cranked the power all the way up to 70MW.

Next he said. "this will be futile, but I am going to call CQ." He turned the power to 50 mw and called CQ once. He said, "this is futile."

I said, "you better stop talking about QRP that way, try again."

He called one more time and YO8CDC came back to him. He talked to this guy on 20 meters and turned the power down to 10mw. The RST was 549.

Next he worked HA5HC in Hungary. He started with 50mw and the RST was 579. He started chatting and turned the power dwon to 10mw. The RST was now still 579 and Emil reported the signal was nice and strong. Next he turned the power to 1mw and the RST went all the way down to 559 with a good report. Conard, WS4S talked with Emil for quite some time on LOW POWER.

Guess

Well my feeling is the antenna is working ok and that I got my money's worth. As I keep saying, "you shouldn't have low expectations on performance just because you are using low power."

From: ron@topaz.bds.com
Message-ID: <22ehd9INNa9t@topaz.bds.com>
Source record: 278938

If it is illegal to sell these radios, then is it illegal to use them? Is it legal to use a radio which is type accepted for a part of the spectrum it covers, but not the entire spectrum it covers?

It is legal to posess them. To use a radio in the ham bands does not require type acceptance, so if you want to use it there, that's fine. What you do not want to do, is to use a amateur radio outside the ham bands (except in rare circumstances like CAP and MARS) in frequencies reserved for other services, even IF you have a license to operate in that band. For example, even though my 2M rig will (with a diode change) transmit just fine in the 154 MHz business band and I have authorization to operate there (use an old clunky GE radio), it is not legal to use my non-type accepted ham rig there.

Mitch, you may want to join the qrp list as you will find answers to all
your questions. Here is an excert from the list's welcome message with
subscription info:

The mailing list address is QRP@Think.COM; mail to that address will be
sent to everyone on the list without human intervention. There is also an
administrative address QRP-Request@Think.COM which will be monitored by the
list maintainer(s); please use that for such requests as adding or removing
yourself from the list, questions about the FTP access, etc.

Good luck and 73

From: ham@wam.umd.edu
Message-ID: <22ei3e$d50@cville-srv.wam.umd.edu>
Source record: 278937

I think that the point here is that maybe Kenwood forgot (?) to install a diode in the radio that prevents it from transmitting out of the ham bands "OUT OF THE BOX."

Doing an out-of-band "modification" is just fine, to the best of my knowledge. My Icom 735, bought used at a hamfest, transmits everywhere. There are mods for nearly every general-coverage radio in existence to allow out-of-band transmit. All I can think is that Kenwood failed to include a clippable diode in the radio to prevent out of band xmit.

At any rate, the stores shouldn't be reponsible for this. When you buy stuff from a company, maybe you test one, but if the specs say it won't transmit out of band (without aftermarket modification), you kind of assume that ALL of the equipment complies to the standard. That's the idea of mass-production.

Can you imagine if Circuit City had to test EVERY VCR, TV, Stereo, Microwave, and telephone it sold to make sure they met the FCC's type B acceptance?

It's the job of the manufacturer. When the manufacturer stamps that Quality Control "OK" on it, you assume it's OK.

bodoh@dgg.cr.usgs.gov (Tom Bodoh) writes:
|As another impatient newbie I can only pass on what I've heard. I have seen
|recent postings that varied from 4 to 8 weeks - with 7 weeks being
|what most people are seeing. I've only heard of two getting theirs in 4
|weeks - and I'm not sure how that would have happened.

I think at least some of these were for novice licenses - before July
1 applicants mailed their filled-out 610s directly to the FCC,
bypassing any processing time by VEs and VECs and the extra mailing
time as well.

(Novice applicants must now go to a VE session and their paperwork is
handled by a VEC. There is now no difference between how novices and
other license classes are treated, EXCEPT that at under the ARRL VEC,
applicants who only attempt elements 1a and 2 are not charged the
$5.60 VE fee [or it will be refunded before they leave].)

|Assuming that you tested with a ARRL VE team, the VE and VEC are not the
|big holdup. Our VE's mail their paperwork to the ARRL the next day and
|they said that the ARRL processes them the day received and Fedex's them
|to the FCC.

I understand that the VEC can take up to a week under peak conditions
-- even they are occasionally swamped. I think I remember reading
that March and September/October are particularly busy times.

I don't think we will see the FCC getting as far behind as they did
last November and December, when I guess they got shorthanded for a while.

Check the mailbox each Friday, Saturday and Monday. Your license will
most likely be mailed on a Thursday.

: >i am currently using an Icom 730 with a Pyramid Power Supply (12-15v @ 25A)
: >and feeding the rig with a random wire thrown out of my bedroom window.
: >The problem that I am having is that on 40m and 20m, i cannot get the rig
: >to put out 100w. The tuner has a built in SWR/Power meter and I can get
: >the SWR below 2:1, but I can't seem to get more than 50w output.
:
I didn't see the original posting, but this clip sounds so familiar, maybe
I can help...

I have a Yaesu FT-767GX which also has a built-in tuner, and I tried the
same technique to load up my old shortwave long-wire, with terrible results.
I could get the SWR down, and even a bit of power out, but any change in
frequency or the position of the wires would send the match into the toilet.

The solution was not in the antenna tuner, but rather the antenna itself.
I added a 1/4 wave matching section of open wire line between the feed line
(coax) and the antenna. This was made with a piece of wire and a pile of
popsicle sticks, cut in half. I was lucky (it just happened to work out), but
you will also need to have the antenna itself be a multiple of 1/2 wavelength
long (mine is 3/2's). What you will end up with is an extended, end-fed Zep.

```
---------------
/ | | | |
/ | | | |
============= | | | |
-------------------------------------------------------------------------
=============

coax feed <--1/4 wave---> <-------- n 1/2 wave ----------------->
```

Of course, you will need to pick a band to operate on, but I've found that
some of the bands are close enough harmonically to get a fair match.
In my case, my 10M antenna also works fairly well on 15 and the low end of 6.

Good luck,

Greg KD6KGW

To which I'll add "or other countries".

> An amateur operating under a US license is expected by the FCC to abide
> by US amateur regulations, no matter where in the world he/she happens
> to be located at the time.

Sorry. I don't buy this. When you operate in another country you must
obey *their* law, of course, but not ours.

Carried out to it's illogical extreme: If I drive on the Autobahn in
Germany, I must not exceed 65 mi/h because that is the maximum in Arkansas
and that is where I am licensed ... :-)

>
> Likewise, an amateur from another country, operating in the US, is
> expected by the FCC to abide by US amateur regulations, even though

|> Bob KD1GG

Of course there's no difference electricaly. A bit of an emotional difference however. I would have felt rather silly if I'd blown $6 shipping and lost the use of the HT for a week just for someone to tweak a potentiometer. Since I don't have enough surface-mount handling tools to do anything but _remove_ components (and that with some trepidation), it's just as well that they did it.

The HT, by the way, is less susceptable to intermod, and seems to hear all of the same stations as before. It now works much better in the situation where I was having problems before - two HTs close together operating the same repeater.

I'm sorry you don't buy this, because the FCC does. I happened to be browsing
through the FCC Rule book and part 97--OK, I'm wierd---when I came across this
particular section. *It is true!!!* If you were to operate in Canada with a
US amateur radio license, you must observe US rules as well as Canadian. If
you check in Part 97 itself it even tells you what frequencies you may operate
in the different ITU regions for the different US operator classes. Check it
out. It is all part of reciprocal licensing.

> Take the SB-102, for example. It doesn't have
> [long list of things the SB-102 doesn't have]
> but neither did any other rig of its day.

Quite true, but the relevant comparison is what an SB-102
can do for the money, compared to other used rigs you can get
today.

>It does have... good stability, and adequate sensitivity and
selectivity...

Hmmm... yours must be a lot more stable than mine ever was.
For the rest, I think the operative word here is "adequate".
I quite agree: you can have a lot of fun for not much money
with old Heathkits. I was just pointing out that one shouldn't
pay too much for them, as rigs with considerably better
performance and more features sell for not much more.

[remainder deleted]

I would be surprised that shops are being busted for selling amateur radios simply capable of out-of-band operation. I suspect that the shops, if they are indeed being busted, are being busted for blatantly selling the radios for non-amateur use.

In other words, I walk into Mike and Tony's Ham Store and ask for an HT to use on the 154.600 Mhz itinerant frequency. If they say, "Here, use this modified amateur Icom, it'll work", then they've intentionally sold you non-type accepteded gear where a type accepted radio is required.

Okay...Info-Hams folks.

I am having trouble interfacing my Alinco DJ-580 HT to my MFJ-1278B
TNC. Has anyone successfully done this and what is the secret
words and/or gestures needed to make it work? The MFJ documentation
does not give any information about using any type of Alinco equipment
so I have been experimenting with various combinations of values
of resistors and capacitors without any success.

I can receive packets fine, I just can't get the radio to key up!!??

Any help would be greatly appreciated?

All wise cracks about going out and buying a new radio will be
ignored!! :-)

thanks and 73s - Warren (KD4YRN)

5183. teletypes

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 19:55:00 UTC
From: ard@siva.bris.ac.uk
Message-ID: <19JUL199320554768@siva.bris.ac.uk>
Source record: 278953

Sorry about my last message to this group - I managed to mangle the header :-(.
Anyway, here's the info again :

The most common teletypes to turn up second hand seem to be :

28 - Massive, 5bit machine
32 - 5 bit version of the 33 and shares many parts with it.
33 - The canonical teletype. ASCII, very mechanical, noisy :-), round keytops. Versions include : RO-33 (no keyboard, printer only), KSR33 (keyboard and printer, no paper tape), ASR33 (keyboard, printer, punch, reader). There were also some specials, like detatched keyboards, different character sets, sprocket feed, etc.
35,37 - basically more rugged/or with lower case ASCII machines. I have no info on these.
43 - Small, plastic case, electronic (very), dot-matrix printhead, switch-mode psu + TTL-line convertor in rear housing, logic board flat in base, capacitive keyboard. Had 3 main versions (RO43 - no keyboard, KSR43 - keyboard/printer, ASR43 - external paper tape unit).

Now to answer the questions :
Ribbons:
In the UK, Inmac still list teletype 43 ribbon cartridges. The 33 ribbon is a standard-ish typewriter ribbon and should be available. It's the same as an Okidata 80 ribbon, or a Commodore 2023 ribbon btw.
Re-inking the 33 ribbon should be OK. I never re-ink dot-matrix ribbons as I value my printheads, although the 43 printhead can be stripped and repaired. I still think you can get a new ribbon though.

Interfacing:
Current-loop was an older (and often more reliable) standard. Basically, you have a loop containing a transmitter (a switch) and a receiver (a current detector) and a current source. The current source can be built in to eitehr the Tx or the Rx, which is then called 'active' (without it it's called 'passive'), and each loop must have exacly one current source. You send data by turning the switch on and off at the right rate. In the ASR33 (and I assume the 32, although all my 5 bit stuff is Creeds), the switch is literally that - a combination of mechanical contacts on the keyboard an the transmit commutator. The ASR33's receiver is a 2-transistor amplifier to drive the receive magnet. Almost all teletype interfaces are passive The current flows in the idle state, which corresponds to the -ve state of the RS232 line. Both the transmitter and receiver should be opto-isolated from your computer/TNC.

The teletype 43 often has both current loop and RS232 on the same connector. the RS232 pinout is standard, and the current loop uses otherwise spare pins. You have to strap pins 3-4 to use current loop. The 33 has many versions. The standard one for line working has a current loop interface with a 9 pole

terminal strip at the back. Terminals 1 and 2 are 115V mains, so be careful. I can look up the others if you like. There are other versions for modem working with autodialers etc built in. Data Dynamics packed the 33 chassis into a new case with their own electronics which did RS232 as well. You can fairly easily convert RS232-current loop - I can look up some notes on that as well.

Parts/repairs:
I have services manuals for the 33 and 43 (Note, the 33 manual is 3 books), and most of the 32 manual. I can look up almost anything on these machines.
Parts are almost unobtainable now. The 33 (and earlier) should be less of a problem, as mechanical stuff can be repaired, but the 43 has 40-pin custom chips in it that are (as far as I know) unobtainable.

If you e-mail/post the number of the machine you have, I'll see if I can dig out some info for you...

-tony

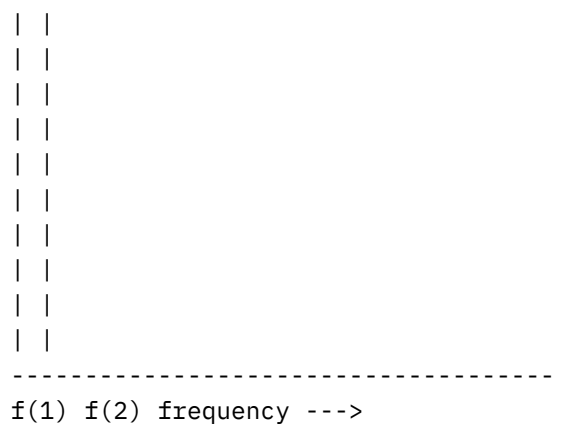
5184. Intermodulation

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 20:38:12 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9307192044.AA10409@netmail.microsoft.com>
Source record: 278954

Intermodulation is when you get two signals modulating each other --
the problem comes when a multiple of one modulates a multiple of the other.

Consider two frequencies, f(1) and f(2). If you want to make this a
little more concrete say f(1) is 10.000Mhz and f(2) is 10.010Mhz.

A specutrum analyser at the output of the ideal amplifier would look
like this :



For an amplifier with nonlinear behaviour harmonics of these two tones
are generated and they are mixed by the nonlinearties in the amplifier.
This produces spurious signals that are related to the input tones.
These are the "intermodulation prodcuts". This is why a "two tone" test
is used to measure the performance of amplifiers (and mixers) -- its is
the simplest way to reproduce this behaviour.

f(1) + f(2) we define not to be a problem as this is jsut linear mixer
(or it may even be a desired mixer product!). Similarly with f(1) - f(2).

Interesting things happend when you consider the higher intermod products.

Such as the 3rd order products, like:

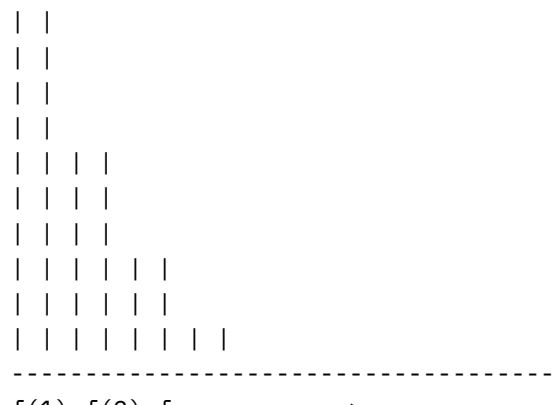
2f(1)-f(2)
2f(2)-f(1)
2f(1)+f(2)
2f(2)+f(1)

These are third order because they involve the mixing of thre
cooponents: f(2), f(2) (to give 2f(2)) and f(1). These are often the
most important products.

Fifth order products are the combinations of 3f(1)

3f(1)-2f(2)
3f(2)-2f(1)
3f(1)+2f(2)
3f(2)+2f(1)

On a frequency analyser these look like:



^ ^ test tones
^ ^ third order
^ ^ fifth order
^ ^ seventh order

The intermodulation products are spaced out by the same amount as the frequecny difference of the two test tones.

Read the bit in ARRL handbook and any introductory comms books should give you a little more background.

To calculate the amplitude of the IMD products you need to know the intercept point of the device (the input power at which the IMD signal is the same power output as the wanted signal), third order signals grow as the third power, fifth order as the fifth power (straight lines with slope 3 and 5 on a log power out vs log power in plot) and a little arithmetic. See my previous post (called TS-50).

> 35,37 - basically more rugged/or with lower case ASCII machines. I have no
> info on these.

The 35 is a faster ASCII terminal that takes pinfeed paper and will do
form feeds (This I found amusing back in my early computing days).

The 37 is an 15 cps upper and lower case machine with hardware tabs and
vertical half and reverse stepping. Uses a typebox rather than a drum
like on the 33's. Can be fitted with an extra (greek) typebox. Also has
a large new line key (no doubt you'll now understand that this was the
primary terminal made available to those who wrote UNIX). My 37 has an
RS-232 interface. The motor won't start until the modem provides DSR
and there's a big green PROCEED light that comes on when you get CD.

Anybody want an ASR-37 with all the tech manuals cheap?

-Ron

plaws@uafhp.uark.edu (Peter Laws) says:

(in relation to: "How does an American sign in Canada?")

>> I'm fairly certain that US law is completely irrelevant
>> when operating in Canada. And vice versa.

>To which I'll add "or other countries".

>> An amateur operating under a US license is expected by the FCC to abide
>> by US amateur regulations, no matter where in the world he/she happens
>> to be located at the time.

>Sorry. I don't buy this. When you operate in another country you must
>obey *their* law, of course, but not ours.

I think I might have messed up the attributions - forgive me...

When you operate with a reciprocal license, your privs are the
intersection of the two sets of privs from each country. Thus,
if you have the highest class G call and operate W1/G3XZY here,
you cannot legally work 40m phone, because the G and W phone
bands have no overlap. Same applies for someone operating as
W1XYZ/G. I doubt that there are serious enough differences
between the US and Canadian licenses for this to be a problem,
although I gather that you can work phone in our CW bands in VE
(it's just not polite to do it). Operating with a reciprocal
call in VE would not allow you to do this, even if you should be
impolite enough to want to, since you can't do it here.

Sorry if I responded to the wrong person above, all these little
arrows get very confusing sometimes....

5190. Yaesu FT-530 HT Mods?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 22:10:00 UTC
From: NIX@bigbrd.AUd.alcatel.COM
Message-ID: <9307192126.AA27116@aud.alcatel.com>
Source record: 278955

I've had spotty access to Info-Hams until recently, so if this
is a repeat of some earlier posting ... I apologize in advance.

There've been several messages concerning modifications to the
Yaesu FT-530 HT. Yaesu was kind enough to fax me a page that
showed how to `open-up' the receiver coverage. I wanted to be
able to listen to aircraft down to 116 MHz, and the `stock'
FT-530 (at least here in the States) only goes down to 130 MHz.

This's the "S13" & "S15" `strap' removal, about which there has
already been some discussion. Removing those two jumpers `opens-
up' the 530's receiver so that it covers 110 - 180 MHz and 300 -
500 MHz; it also turns-on that `OTHER' band, but we won't talk
about that (what's between 800 & 950 MHz in Europe?).

From what I've read here on "Info-Hams", it sounds as though removing
one of the straps (can't remember which one) is to disable the trans-
mitter outside the ham bands. Perhaps some people can legally transmit
`outside', but I can't, and so find some comfort in the fact that my
HT's transmit is inhibited where it's not legal for me to operate
(you put that many features in one little-bitty radio, and the `fat-
finger' syndrome WILL, some day, cause the transmitter to be asked
to turn-on, when the radio's outside the ham bands.).

The `expanded' FT-530 receives well, although it does have some tendency
to suffer from images on VHF (haven't noticed them on the UHF side).
I spoke with Yaesu, and they confirmed that the receiver's `front-end'
varactor-tuning preselector is way outside its alignment range when down
in the aircraft band (I heard the Dallas `88 repeater down in the aircraft
band, at twice the receiver's IF (15.25 MHz) `down'. And yes, I DID have
the AM detector on).

Now, having said all this, I'd like to ask if anybody's got information
regarding what the other `straps' do in the FT-530? I think that there
are either 15 or 16 `straps' (really miniscule solder `blobs' for the most
part) do? That's one of the `limitations' of a software-driven piece of
gear ... no amount of `Schematic-Reading' (notice the words are in cap's,
I'm talking about SERIOUS, late-night, schematic reading!) will result
in revelations about what the item under scrutiny `wants' to do,
under different programming (those `blobs') situations.

Anyone got a buddy in Yaesu's software shop, so we
can find out what other tricks the FT-530 knows?!

Regards;

Paul Nix (WB5AGF) Garland, Texas (north side of Dallas)

krishna-

I agree with your decision. You should use the name you want people to
call you.

A friend of mine is named Horace. He decided that it was too hard to send
on CW, and chose "Bud" to use on the air. Now, after 38 years as a Ham, he
is known as Bud by hams and non-hams alike.

Dave-

I agree with Bob's proposal to apply a low level signal. However, you might have lower losses if you did your phasing on the balanced side, and only used a single balun to get back to co-ax.

I left all the above in for reference....

1st...sence when has the FCC had to 'type accept' a Ham rig?

That 'type acceptance' is for chicken band gear!

I f the acceptance concerns the spectral output of the rig, THEN maybe
it would make sense.
But here it's about the freq coverage a rig has....and boy oh boy, a LOT

of Hams are in hot water.....how about the home made rigs?
NONE are 'type accepted' and some can very easily tune ANY where!
And what about the older rigs like Viking Rangers and V32's and KWM-2's ?

HEY!....our liecence also assumes we know enough to not transmit on
freqs we are not liecenced for!
That is why they ask those questions about the band edges!

Now...what exactly,was the reason for all those fines then?
Did they sell the rigs to chicken banders?
Are the rigs lousy as far as spectral purity(lots of harmonix)?

BUT...if some new law has occured, wher the FCC now has to type accept
ham gear...TELL me which rules these are! (please?) :)

Jim Jacobsen : N9IEO@siucvmb.edu
Recently, I have developed some software that uses the FM voice chips
in the Sound Blaster to send 1200 Baud FSK Packet. I was curious if
there were others around that may have also been able to do this using
the FM music chips. If anyone is interested in this , or interested
in the DTMF sound Blaster tone generator that I have also developed,
please leave me a reply.

5196. Alinco DR-600 Mods

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 23:09:16 UTC
From: levin@cosmic.physics.utah.edu
Message-ID: <1993Jul19.230916.872@fcom.cc.utah.edu>
Source record: 278969

Hi,

I just got the info on how to modify the Alinco DR-600. I have
activated these mods and they seem to work fine. Here they are:

Mod 1 - Activate 108 - 142 MHz and 810 - 998 MHz Receive

Remove head unit from radio and open it up.

Inside you will see a red and blue wire.

Cut the red wire.

Open the main unit and attach a wire to CN-205. This will be
your antenna for 810-998 MHz.

Close everything up.

Reset the CPU by holding down the FUNC key while you turn the
radio on.

To use:
The VHF key toggles between 108-142 and 2m. This toggle
only works in VFO mode.

The UHF key toggles between 810-998 and 70cm. This toggle
only works in VFO mode.

Mod 2 - Extened tx/rx on 2m and 70cm

Remove head unit from radio and open it. (2 screws on back)

Inside you will see a red and a blue wire.

Cut the blue wire.

Put everything back together.

Reset the CPU by holding down the FUNC key while you turn
the radio on.

You can now transmit and receive on the following freqs:
130-174MHz and 400-517MHz

Be carefull!!!!! You can now transmit outside of the HAM
bands. Don't do this! If you do you WILL get caught and
the FCC loves those $10,000 fines.

NOTE: I take no responsibility for these modifications. If you blow up your radio it is not my fault. If you have any questions about these mods call Alinco.

Paul-

I have buttons 3 and 4 set up to do what you mentioned. Button 3 does the USB-LSB-CW, and button 4 does the AM-FM.

This points out one minor problem I've experienced. Sometimes, while pressing the up-down buttons to change memory channels, one of the programmed buttons will activate instead. I notice that they use the up-down button leads to multiplex the programmed buttons. I wonder if anyone else has experienced this?

With regard to the S-meter calibration, I got into a "discussion" the other day, about how many dB there were in an S-Unit. Since back in the 50's, I had always heard that there was no absolute standard, but most receivers were supposed to be "about 6 dB" per S-Unit. I recall that in the late 50's/early 60's, only one manufacturer had made a claim, and had stated 5 dB per S-Unit.

After the discussion, I went home and dug out an old signal generator, and tried to measure a TS-120S and a TS-690. When funny things happened, I put a ten dB pad between the generator and the receiver under test. The final results were that you just can't trust an S-Meter! I found values ranging from 1.6 dB, up to 13.2 dB per S-Unit. The dB above S-9 measurements were less than the dial indicated, in all cases.

I hope to repeat this test with another, newer signal generator, and also measure the TS-50 for comparison. If anyone else has tried this with good lab equipment, I'd like to hear the results.

5198. Motorola Mostar Help needed

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-19 23:37:55 UTC
From: Brooks_michael@Tandem.com
Message-ID: <Brooks_michael-190793163334@130.252.109.65>
Source record: 278968

I have a motorola Mostar 8 channel radio. I have successfully been able
to reprogram the 8 channels to 2m. I would like to now add more channels.
The radio uses a 2804 eeprom, except in the 8 channel version the high
address line isn't used. I added a binary switch and changed the prom
to a 2716(the pinouts are the same). The binary switch should now act
like a bank switch into the 2716. Each channel takes 32 bytes.
Using this method I should be able to get 8 banks of 8 frequencies, but it
doesn't seem to work. I've even had a friend re-do everything, cause he
figured it had to work and I had screwed it up. Well, it doesn't work for
him either.

Has anyone done this? Is there some hidden feature of the 2804 that makes
them not compatible with the 2716? Any and all help would be appreciated.

If you want more details of what we attempted let me know and I will
re-post.

Thanks,
Michael, N6UGX

Now for the question I've never seen a clear answer to: If I, as an American ham, operate under the reciprocal agreement in Canada, how do my American band and segment privileges translate to operation in Canada? As an Extra-class operator, do I operate under the Canadian segmentation(or the lack of it), or am I still constrained by the American band segments? How do the other license classes translate to operation in Canada?

Hmmm... The original post said the TTY has an RS-232 connector on it.
From this I would assume that the current loop interface is already there.

I'd really like to find a set of those 300 baud gears for the model 33 that
were mentioned. I have several of the things, all at the 110 baud rate
I so fondly remember. :) Also, my model 15 does 45.45 baud baudot. I
can usually find a QSO using this mode on some band or other to eavesdrop
on. Also, ARRL bulletins are still transmitted this way.

Uh oh. (A big green DUFUS light goes off in my head.) This isn't, by
any chance, similar to the model 38, is it? Someone gave me one some
time ago, supposedly working, but I wasn't able to get the motor to come
on. I haven't looked at it in awhile, but it's a large (desk sized) beast,
with upper and lower case and built in tape reader/punch. I got a pile of
documentation with it, but no motor seemed an obvious problem. Of course
I started out at the line cord and worked in. I soon gave up, as other
things got priority. Perhaps it's time to exhume this one. :)

Guess it's time to repost this note I originally posted about a year ago:

DERRY@ROSEVC.Rose-Hulman.EDU:

>How may dB correspond to one S unit?

>Is there a uniform well defined standard?

>tnx es 73 de k9cun (Jack Derry)

Contrary to popular belief, there is no standard for S-unit size. Here's
why: The S-meter generally simply measures a receiver's AGC voltage.
To make an S-meter have a consistent number of dB per S-unit would require
an AGC characteristic which is purely logarithmic over a wide range. This
isn't otherwise required for proper receiver operation, and requires
considerable effort to accomplish, so manufacturers of amateur equipment
don't have any incentive to do so. That is, it costs money to implement and
doesn't sell rigs, so it isn't done. (I'm told but haven't verified that the
old Collins rigs had not only a consistently sized S-unit, but a calibrated
signal strength for S9. Neither of these is so for modern rigs.)

I frequently give talks on antennas at local clubs and conventions. As part
of the talk, I take a "vote" on how many dB in an S-unit. The results
are pretty consistent, with a peak at 6 dB and a smaller peak at 3. After
taking the vote, I show the measured S-meter response of my home
"appliance", an Icom IC-730, on 40 meters without the preamp. The S-units

on this receiver vary from 1.3 to 4.0 dB depending on the place on the scale, and the "10 dB" increments above S9 range from 5.6 to 13.5 dB. I always cringe when a writer sees a 2 S-unit difference between antennas and concludes that the difference is 12 dB or some similar ridiculous amount, when the real difference may be less than 3 dB. What the hell, only off by 9 dB! (The antenna would have to be about 8 TIMES larger to make up the difference.)

Not only is the S-unit size liable to vary over the scale, but also with band and whether a preamp or attenuator is switched in. Incidentally, the sensitiviy of my Icom scale isn't even monotonic -- it goes up and down as you go up the scale.

Measure your own S-meter. It's simple. A completely adequate step attenuator can be built in an evening with slide switches, 5% resistors, and unetched double-sided PC board. See the ARRL Handbook or Antenna Book for details. The only other thing needed is a strong constant signal. With the attenuator you'll also be able to dazzle your friends by actually being able to MEASURE RELATIVE ANTENNA GAIN! You need two antennas for comparison. Put the attenuator in series with the better antenna, and arrange a simple slide or toggle switch to switch between the antennas. While listening to a signal, switch between antennas and set the attenuator until they give equal readings on your S-meter. The attenuator setting is the relative gain. In dB, NOT S-units! You'll probably find that the gain varies considerably depending on the direction the signal is coming from, the elevation arrival angle, with the fading cycle when fading is present, and perhaps with seasonal ground conductivity changes.

Please, please don't quote gains in S-units. Gain in "potatoes" would be as meaningful and less misleading.

I think this is what you need. It's from Jay Appel's manual on the
DJ-580
- Bruce Perens KD6OTD

13.1 ENABLE SPEAKER FULL-DUPLEX

Enabling the speaker will cause feedback unless an external
earphone or headset is used.

1. Press and hold the FUNC key, then press the * key. The LCD
should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD
should display Fd-on. Repeat this step until the field
indicates Fd-on.

3. Press and hold the FUNC key, then press the FL/PL key
repeatedly until the FL and PL indicators are absent from the
LCD display.

13.2 DISABLE SPEAKER SEMI-DUPLEX

Perform the following steps:

1. Press and hold the FUNC key, then press the * key. The LCD
should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD
should display Fd-oF. Repeat this step until the field
indicates Fd-oF.

3. Press and hold the FUNC key, then press the FL/PL key
repeatedly until the FL and PL indicators are absent from the
LCD display.

> f(1) + f(2) we define not to be a problem as this is jsut linear mixer
> (or it may even be a desired mixer product!). Similarly with f(1) - f(2).

This isn't quite right; first of all, it is the nonlinearities of an amplifier that generate the harmonics, etc., in the first place, not just "mixing" them. A "mixer" is SUPPOSED to be a nonlinear circuit; you DO NOT get a component at f(1) + f(2) through any simple linear action. And a component at that frequency cannot simply be "defined" as a non-problem; it may most definitely be an undesired signal, and does in any event represent distortion since it is NOT present in the original input. (I'm talking from a linear amplifier perspective, here; certainly, in a mixer, you *want* these things to happen.

This may all be better understood by simply looking at the problem mathematically (don't run off, this'll be almost painless). An ideal amplifier would be perfectly linear, which means that its operation would be characterized by a simple linear equation, i.e.,

Vout = A x Vin

where A is, of course, the amplifier gain (which can be fractional or negative - it doesn't matter, it's still the equation of a line). What you get out is an exact-but-scaled replica of what you put in.

But such a perfect amplifier is impossible; there is always some deviation from perfect linearity. Conceivably, you could describe the *real* operation by an equation of some order N, although N might have to get pretty high in order to do so. The simplest non-linear equation we can consider, though, will be useful to see the problem of non-linearity. Suppose we add a squared term, like this:

Vout = AVin^2 + BVin

Here, the "B" term is the linear one, the action we want - simple scaling of the input. The problems are all in the first part, the squared term. Even if the input is a sine wave, distortion is clearly occuring; and what happens if the input is something slightly more complex? Consider the case of the input being TWO sinusoids:

Vin = Csin(2piF1(t)) + Dsin(2piF2(t))

These have amplitudes C and D and frequencies (in Hz) of F1 and F2. If you plug this in for Vin in the second term, you get the desired action - components at frequencies F1 and F2, scaled by the gain B. But if you plug THIS Vin into the first (squared) term, you get out some nasty results:

- Components at twice each frequency; these are the "harmonics" of the original signals. PLUS, you get

- Components at the sum and difference frequencies, resulting from the term 2CDsin(2piF1(t))sin(2piF2(t)). THESE are what result in what appear to be "sidebands" in the spectrum, and are also what makes AM work (if this were supposed to be an AM modulator, that is). Hence the term "intermodulation", or "intermod."

Actually, the latter set of frequencies is more often a problem than the harmonics; 2X the original frequency is usually far enough removed from the desired signal so as to be easily filtered out. But these "sideband-like" products are RIGHT THERE, stuck in and among the components you wanted in the first place. As such, they represent a distortion that is more difficult to get rid of than the simple harmonics.

At the sessions where I've been a VE(mostly with the Mountaineer Amateur
Radio Association team in Fairmont, WV), we've generally kept it quiet to
the point where the VE's grading tests have to be a bit cautious in handling
papers lest the paper noise serve as a distraction. People just outside the
testing area whose conversation gets loud enough to intrude into the testing
area are generally asked to reduce the volume or move the conversation away.

5207. Re: TS50 Illegal!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 03:06:31 UTC
From: wtm@uhura.neoucom.edu
Message-ID: <1993Jul20.030631.2039@uhura.neoucom.edu>
Source record: 278878

I was wondering about the FCC dinging the three dealers in California too. According to the report, the dealers were fined for selling radios as amateur equipment, capable of transmitting on additional frequencies. The radios did not have apropriate FCC approval. The FCC conducted its investigation in early march of 1993 following a complaint about the TS-50's alleged out-of-band trnasmit capabilities.

Westlink reported that the dealers represented the units as having additional transmit capabilities and there was literature accompanying the units stating such. Two of the three dealers confirmed the claims to a government ivestigator, according to Westlink. It was reported that Kenwood's Washington-based lawyer has been called in to help resolve the problem. Current sales of TS-50s are supposedly not affected.

I wonder if the dealers were selling gray market TS-50s? That was about the time the radio first became available. Perhaps, the objection is over the availability of a mod sheet explaining how to expand the radio.

It sure is great having the FCC get bent out of shape over this stuff instead of getting rid of CB bandits on 10 meters.

I have an opportunity to pick up an Icom P2AT for a real reasonable price. (he needs the money). I know it does out of band receive, but what about out of band transmit so I could use it on low power for business band, or for marine communications. Thanks for info. you might have.

> 1st...sence when has the FCC had to 'type accept' a Ham rig?

Part 97.307 says all equipment must meet FCC standards for spectral purity.
Check the back panel of any recent rig for the FCC ID number. The FCC
doesn't allow manufacturers to market amplifiers capable of out-of-the-box
operation on 10m if there is not circuitry present to prevent operation on
11m. Thank the illegal CB operators for that one. All RF external amplifiers
capable of operation below 144MHz must be type-accepted to be commercially
marketed (97.315). Other ham gear does not have to be type accepted to
be marketed commercially.

>Now...what exactly,was the reason for all those fines then?
> Did they sell the rigs to chicken banders?

I suspect you hit the nail on the head.

> Thus, to have a separate code room would require six VEs.

Our usual approach was to get the code tests out of the way first thing.
People only taking written exams would be given their first exam, but
instructed that if the code was going to be a distraction, they might want
to wait until the code tests end before they started on the tests. This way
the examinee can decide if he/she wants to get started immediately (and
perhaps get done a bit sooner) or to wait a few minutes and have a
relatively quiet room to take the test in.

>That 'type acceptance' is for chicken band gear!

The FCC does "type acceptance" on "commercial" ham rigs.
I don't know when that may have started, but it is the
normal process by which new equipment is first checked
out before being available.

> If the acceptance concerns the spectral output of the rig, THEN maybe
>it would make sense.
> But here it's about the freq coverage a rig has....and boy oh boy, a LOT
>of Hams are in hot water.....how about the home made rigs?
> NONE are 'type accepted' and some can very easily tune ANY where!
>And what about the older rigs like Viking Rangers and V32's and KWM-2's ?

There is no requirement that "home brew" rigs be type accepted, nor is
there any "retroactive" requirement for type acceptance of older/used
rigs.

The government can send troops into a foreign country and kidnap a citizen
of that country for trial in the UNited States, according to our laws (not
according to general international agreement, but might makes right).

>Even when those laws conflict/differ from the foreign country's laws?

I'm pretty sure that no country *requires* you to broadcast on a particular
frequency, since there's no law which says you have to broadcast at all.

This belongs in misc.legal, I suspect.

>I am looking for a source of professional quality earphones (i.e.,
>skin colored, coiled wire, SMALL, etc. The only thing RS seems to
>carry are these black jobs. They work fine, but are not very
>inconspicuous.

I have worn earphones professionally for years. I have never
seen a skin coloured pair. Also I recommend big headphones. They sound
better. The ones I use do not have coiled wire either. The wire is
steel and copper for strength.

My favourite brand is Sennheiser. The best open ones are the
HD 430. The best closed ones are HD-222. Other brands used
professionally are AKG (Philips) and Koss. You can buy these kind of
headsets in good high-fi stores and electronics stores and
distributors that supply the broadcast industry.

Now if you want a telephone headset, some of those are skin
coloured. The best are probably Plantronics. They cost around $200
depending on model. But they will rebuild them for $25.00, so they do
last forever. You can get telephone headsets from "Telecom
distributors", they are usually in the Yellow pages. Plantronics will
send you a brochure. I buy my headsets from Alltel (800) 634-9086. You
can also buy them from Hello Direct (not cheap) (800) 444-3556.

Rebuilt headsets can be bought from Comfort telecommunications
(813) 945-0288. They will sell a rebuilt headset with a 14 month
guarantee.

Yes, all of the above are digital ready and will copy Morris.

Thanks for the responces about MPF102 replacement...
I am posting a (usefull I think) summary.

73 de George (SV3CHA)

****

Hi, George...If memory serves me, I believe the 2N4416 is a suitable
drop-in replacement for the MPF102. The QST "Ugly Weekender" project
from a decade or so ago uses the 2N4416 in the VFO (if I am recalling
correctly); seems like the article noted that an MPF102 could be used
instead, but the VFO output would be reduced somewhat.

This is all from memory--I don't have the article in front of me.
Sorry...
73 de aa0ms

****

I'm a bit baffled by your request. The MPF102 is by far the most
commonly available VHF JFET, at least here in the States. There are
lots of second sources; it certainly doesn't have to come from Motorola.

Are you having trouble finding it, or are you looking for a similar
part for some other application? Most MPF102 applications will work
with any small-signal JFET with Ft above 500 MHz or so.

73 de ke9tv/2, Kevin KENNY GE Corporate R&D, Niskayuna, New York, USA

****

Almost any jfet will work.

Even the pack of 10 on a card from 'rat shit shack' will usually work
as an mpf102.

Most of them are good to about 10 mhz, but you need to check the biasing
resistor on each and every one, since tolerances are HUGE.

Bob

****

Hi...I was able to get them from Radio Shack! I also got a replacement...
I'll try to look up the number in my handbook tonight.

Anyway, after I got a replacement part from a mail-order place, I found
one in a Radio Shack in Santa Fe. It is a standard stock item....

-Tom
KJ5LT

****

The MPF102 was the "economy" version of an RF N-Channel J-FET, as I recall. I've searched my Motorola literature, and can find no reference to it any more recent than 1974.

A better transistor of that generation, that is still available, is the 2N4416A. It is in a metal can instead of the plastic case, and has higher gain than the MPF102. Another transistor that may be useful is the 2N3821. I'm not familiar with it, but it is listed along with the 2N4416A, in the 1992 issue of the Motorola "Master Selection Guide".

73, Fred, K4DII
****

The 2N4416 is similar and more tightly specified. It's a good replacement choice.

Roy Lewallen, W7EL

****

Well, you could try using a ... MPF102! They are easily found, and currently manufacturered. Check Digi-key, or Jameco, or Mouser, or DC Electronics, or... you get the idea. You might even be able to still get them from Radio Shark.

73,

Chuck Harris - WA3UQV
chuck@eng.umd.edu

****

Gee, I haven't had any trouble finding it until now.

Anyway, it depends some on the application. Devices with similar specs include:

2N5457-2N5459 (VHF)
2N5484-2N5486 (general purpose)
2N4416 (RF)
J308-J310
NTE/ECG 451-452

No guarantees that any of them will be a plug-in direct replacement in any given application, but some creative reading of the specs should allow you to adapt the circuit.

Some of these have a higher gain-bandwidth product than the MPF102, so you may need to add some impedance to the gate lead to suppress VHF/UHF parasitics, depending on the circuit layout.

73 de ke9tv/2, Kevin

****

The NTE replacement for the MPF-102 is the NTE451;
J Fet N-Ch. VHF/UHF amp, TO92
Cheers;
Howard Anders

5219. Teletype models (long)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 06:03:25 UTC
From: haynes@cats.ucsc.edu
Message-ID: <22g1rdINNfm4@darkstar.UCSC.EDU>
Source record: 278885

Since someone mentioned "canonical" we might as well go through as much
of the list as I can remember.

RO = receive only
KSR = keyboard send/receive
ASR = automatic send/receive, which usually means paper tape

12 - page machine. These were used by amateurs, especially in New York
in the early 50s. Type bars, like an old typewriter. 60WPM.
14 - tape strip printer, KSR or RO. Used mainly by Western Union (which
called it the 2-B) Also the printer is the basis of a typing
reperforator. The tape reader XD is also usually considered part
of the Model 14 line, and sometimes the GPE perforator. Type bars.
60 WPM. (66 WPM in the Western Union version, with 7.0 unit code;
but 45.45 baud in either case.)
15 - page printer, KSR or RO. Made from about 1930 until the mid-1950s,
these were the mainstay of the news wire services and the military
until the Model 28 came out. You'll still hear radio stations use
the sound effects of a Model 15 as background when they are reading
the news. Uses type bars, but unlike a typewriter the paper is
stationary and the type bar "basket" moves across the page.
60 and 75 WPM. FAA ran some of these at 100 WPM experimentally
but they required too much maintenance at that speed.
19 - ASR set, consists of Model 15 printer, XD tape reader, and the
keyboard is basically Model 15 but has a tape perforator attached.
20 - page printer, similar to Model 15 but uses 6-level code and prints
upper/lower case in Teletypesetter code.
21A - A Western Union tape printer, parallel wire input, used on multiplex
circuits. Type bars.
26 - A light-duty page printer KSR made in the late 1930s. A lot of these
wound up in amateur hands in the 1950s, especially in California, as
the telephone companies replaced them with Model 15s or 28s. Used a
type wheel holding individual type slugs. The paper platen moved
from side to side. The 26 failed as a product because it was not
sufficiently cheaper than the 15 to justify stocking parts and having
maintenance expertise for it and the Model 15. 60 WPM.
28 - A heavy-duty page printer introduced in the early 1950s. Used a
moving type box holding individual type slugs. First production all
went to the military; it was popular with the Navy because unlike the
15 it was not bothered by the ship pitching and rolling. In fact there
was a demo setup of a printer in gimbals to show that it could operate
in any position. Capable of 100 WPM. ASR version introduced in late
1950s.
29 - Based on the 28, but made to work with 6-level code based on IBM BCD.
Supposedly used only internally within Western Electric.

31 - A lightweight tape printer KSR for portable use. Western Union
used them for reporting baseball games.
32 - Early 1960s era light duty low cost machine for 5 level code.
33 - Same as 32 but 8-level ASCII code (upper case only). These machines
were made in RO, KSR, and ASR versions. The ASR 33 became very popular
as a cheap computer console device. 32s were mostly used by Western
Union in Telex service; 33s were used by Bell System in Dial TWX
service. 100WPM max. Both noted for lousy keyboard touch, the 33
being worse than the 32 because it had to generate more bits.
Cost of the printers was held down by no using plated and hardened
parts; adjustment was often by bending parts rather than loosening
and tightening adjusting screws. The printer used a stationary
platen and a molded type cylinder. This printing mechanism was
used earlier in Model 28 typing reperforators.
35 - A reworking of the 29 to use ASCII code, more "modern" cabinet similar
to the 32/33 line, heavy-duty like the 28/29, available in RO, KSR, ASR
versions. 100 WPM max. Some use as computer consoles where better
reliability was needed than was possible with the 33.
37 - Was to have been the mainstay of the product line had AT&T remained
in one piece and not sold off TWX to Western Union. 150 WPM,
upper/lower case ASCII, online settable tabs, the works. Not enough
were produced to get the early reliability problems out of it; it
was very costly; and it had a terrible keyboard based on the 32/33
design. Type box similar to 28/35 but larger to accomodate the full
ASCII character set.
38 - Was to have been an upper/lower case version of the 33 - but then
somebody decided it should take 14" wide paper. Stretching the
width introduced some reliability problems that were never fixed.
Used the same despicable keyboard as the 37. 100WPM max.
40 - A product line that included CRT terminals and some printers based
on chain principle. Printers available in 80 or 132 column models,
up/low case or upper only, speed depends on character set and
nature of printing but 2400 WPM is usually possible.
43 - Dot matrix small RO or KSR, nice electronic keyboard. Up to 300 WPM.
GPE - old tape perforator, called the "iron horse", often seen in amateur
stations (as a door stop).
DPE - slightly more modern perforator, the keyboard and perforator mechanism
of the Model 19, less the keyboard signal generator.
Inktronic - an ink jet printer. Unlike the modern successful ones this
beast electrostatically deflected ink droplets from 40 nozzles (each
nozzle serving two column positions). Produced in RO and KSR models,
the KSR using the same vile keyboard as the Model 37 and 38.
1200 WPM, upper/lower case. When the printer was new the copy was
readable, and went inexorably downhill after that.
High speed products: tape readers BX, CX, and DX (suggests there was an
AX at one time), perforators BRPE and DRPE, capable of 1200 and
2400 WPM respectively.
100-series - Western Union occasionally dabbled with making its own
machines. These were page printers with type baskets, 60 wpm.
Kleinschmidt - semi-competitor to Teletype, specialized in machines for

the military market.
MITE - another company that got into the business in the 60s producing
a very compact light weight machine for the military.
Extel - some former Teletype people (hence the name, ex-Teletype) formed
a company to make dot matrix printers, sold principally to the news
wire services.

No. But the forgien country can make such requirements.

I believe _Canada_ (not the US) requires that US amateurs comply with their (US) band limits, as well as the Canadian limits, while in Canada.

I recall some time ago that there was some action to have the DOC adjust the rules so that Europeans could use 146 - 148 MHz in Canada, although they would not be able to use that part of 2 metres at home.

I would be surprised if selling a radio _capable_ of operating outside the ham bands was illegal, since it was not until the advent of microprocessor controlled, frequency synthesized radios that it was even _possible_ to make a radio with hard band limits.

My original HF rig, a TS-820, would tune a short distance outside the bands as manufactured, simply because that's the way the dial mechanism worked.

I used to work with a woman whose hearing went higher in frequency than
usual. A misadjusted or just plain old monitor would run her out of the
room because the 15075 Hz horizontal sweep would get too loud.

Ooops... My minicomputer background is showing up again. Yes, the 33 was a cheap machine, sold to many manufacturers (DEC, Philips, etc...) as a console for their minis, and for that reason it is the one shown in nearly all computer books, the one that turns up in computer cartoons, and by far the most common one at uk hamfests (I'm not including Creed machines in that statement).

But, if you look after them, keep them oiled, etc, they will run for a very long time (both of mine are still running on all original parts, even though I have spare bearings, motor, shafts, etc for them).

Does anyone have a complete copy of the FCC release?? It was said that this change would also allow the use of Amateur Radio more in support of education. Was this included? Or is the real thing so vague that we are going to find ourselves in the same boat we have always been with armchair lawyers poo-pooing everything we try and do. If in fact the rules have been made more reasonable and clear, this may be the opportunity we have needed to start doing things that will garner good PR without having to wait for an earthquake or a flood.

Ah, all of the radios I have ever owned (HF, that is) were capable of being operated outside of the ham bands. Contrary to popular opinion, it is not illegal to do so under certain conditions. All of the MARS stations operate that way and hams have been MARS members for many years, running their amateur stations on the MARS frequencies. I do not think there is any such law that says you can't sell non-type accepted radios that transmit outside of the amateur bands, contrary to what the YI report might have said. There are specific laws governing 11 meter operation by some equipment, but I don't believe there is a general one prohibiting sales of ham gear based soley on its ability to transmit outside of the band.

I'm not a lawyer but I suspect there is more to the story...

>August 21, 1989, when the ARRL filed their petition for codeless class of
>amateur license? How many members had an opportunity to choose their board

Michael, old chap, i daresay you are rather uninformed as to the sequence of events relating to the 2/14/91 rules changes for the Technician class amateur radio license.

The FCC waited for the ARRL to make it's proposal, but in the end, they went with the QCWA proposal. The league proposal, in my view, would have been a failure as it would have only allowed operation on bands that are only moderately populated in even the large cities.

in general the ARRL has been taking it on the chin on some major rulemakings recently - the code-free tech being only one of them. It also appears to me that the ARRL has been busy making changes in "things" since their proposal wasn't just rubber-stamped into the regs as might have happed years ago. I think they've come a long way to getting some vitality back into the organization that was not there even 10 years ago.

So, Mike, you should be happy with the Tech outcome because the ARRL didn't get their way.

I don't my way a lot of times either -- I still liked "Subversive Radio Network" over "Space Coast Amateur Technical Group" but you have to pay attention to one's political well-being. Maybe when things settle down it'll be time to try to start up the midnight math and particle physics net again.

5230. IC-735 AGC pumping

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 13:16:31 UTC
From: hideg@spsd10b.erim.org
Message-ID: <HIDEG.93Jul20131631@spsd10b.erim.org>
Source record: 278923

Hello.

I've noticed an interesting problem with my IC-735. On cw mode, if there is a co-channel station that is stronger than the station I'm trying to receive, the AGC responds to the stronger station, thereby modulating the apparent level of the station I'm trying to receive.

I've heard that this phenomenon is sometimes called "AGC pumping". Is there a way to cure it with this radio? I'm currently using a 500Hz cw narrow filter. ICOM has a 250Hz filter available. Would that help? Are there other sources for filters for this radio? Is my radio simply not selective enough (and I'm out of luck)?

I don't know if this is a problem in any other modes. I just noticed this on cw on Field Day.

Any advice would be appreciated.

5232. Algonquin 150' Dish EME Tests

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 13:32:42 UTC
From: MOWE%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <20JUL93.10308743.0022.MUSIC@SLUMUS>
Source record: 278897

FOR IMMEDIATE RELEASE

VE3ONT 46-m (150') Dish to be Active on EME

The Toronto VHF Society, using the callsign VE3ONT, will use the 46-m (150') diameter radio telescope at Algonquin Provincial Park (grid FN05xw) during this year's A.R.R.L. International EME Competition.

VE3ONT will be active the full weekend of each contest period, October 9/10 and November 6/7, 1993. Below is the schedule of operations:

Date VE3ONT TX Freq. Listening range Approx. times (UTC)

Oct 9 432.050 432.050 - 432.060 0445-1830
Oct 10 144.029 144.025 - 144.030 0550-1900
Nov 6 432.050 432.050 - 432.060 0340 1700
Nov 7 1296.050 1296.050 - 1296.060 0450-1730

VE3ONT will operate "split" and we ask that stations avoid calling us on our transmit frequency. VE3ONT will transmit and receive with left-hand circular-polarization (LHCP) off the dish on all bands. This means that after reflection from the Moon, signals will be right-hand circular polarized (RHCP). This will permit us to work stations with vertical, horizontal, or RHCP polarization. VE3ONT will transmit at the legal power limit on 144 and 432 MHz and 100 watts on 1296. Power amplifiers and receiving preamps are located at the dish feed.

As users of a non-amateur antenna, we will not be in competition with other stations. Our intention is to provide an initial EME contact for as many stations as possible. Consequently, we strongly discourage duplicate or "insurance" contacts. Operation will be primarily on CW, although SSB might be employed depending on signal strength and number of stations calling.

All operation will be "random" format, meaning that VE3ONT will accept no skeds. If conditions are poor, we will use a 30-second sequence in which VE3ONT transmits the first 30 seconds and listens during the second 30 seconds of each minute. Note that this is NOT the usual sequence for EME skeds.

VE3ONT will maintain HF liaison on 14.345 during daylight hours and on 3.818 at night.

We anticipate being able to work OSCAR-class stations with 100 watts of output power on 144 and 432 MHz; 25 watts should be sufficient on 1296. Photographs and technical information concerning the dish and VE3ONT's operation will be presented by W9IP and VE3ASO at the Central States VHF

Conference and the Eastern VHF/UHF Conference.

For clarification, contact Dennis Mungham VE3ASO (613) 998-7330/989-2339 or Michael Owen W9IP (315) 379-0161/379-5975. QSL to VE3ONT (Callbook address).

Not all Yaesu radios have transmitted out of band out of the box. Examples are FT-208 (old) and FT-23R (also older). The -23 could be modified by removing a solder blob. I don't recall anything about the FT-470 except that the keypad mods made it a very useful radio.

The FT-530 is an exception to the past. I guess Yaesu got tired of the hassle of giving MARS/CAP operators the info separately.

>DF'ed using the system.

Thomas, I built a virtually identical unit a couple of years ago
for a hunt. I tried several different antenna designs, but the bowtie
was about as good as any, and handier to maneuver during the hunt.
Using two vertical dipoles spaced slightly less than half a wavelength
apart gave the sharpest null, but that was *unhandy*, and the
null was really too sharp and easy to miss on a short transmission
by the fox.

You're right that it doesn't work as well on weak signals. I
used a beam for initial bearings and switched to the handi-finder
as I got closer. The fellow who won used a HT with rubber duck
that he shielded in various ways, a pure signal strength system.
The hunt area was subject to high levels of multipath so the
handi-finder gave many false bearings. A more experienced hunter
might have done better with it than I did, but I still had fun
trying. The key to using the device well, as with most T hunt
equipment, is lots of practice. Go out and track down your
neighbor hams, local repeaters, and public service agency repeaters
in advance of the hunt. I've chased the National Weather transmitter
several times from several different starting locations. It's
been instructive to see how terrain confuses apparent signal direction.

From: michel@bbn.com
Message-ID: <9307201333.AA22394@ucsd.edu>
Source record: 278894

Warren, KD4YRN, complains that his TNC will not key his DJ-580. He says
he tried "various values" of R & C.

Warren - You didn't say what values you tried. I found that with a PacComm Tiny-2
(quite a nice box) I required a resistor no larger than 2.7K to get my DJ-580
to key. As I recall, the recommended value was 5K, but that didn't work. I
didn't fool around with a capacitor, and I didn't use the recommended 3-pin
connector (available where?), so I'm probably wasting some power by shorting
the mike power limiting resistor to ground. But it keys fine, it runs for a
long time on a battery charge, and the radio doesn't get very hot. Try a smaller
pull-down resistor. (Not too small, though!)

>The bottom line is this: what can the ARRL do to improve the general
>public's image of Amateur Radio? What *should* the League do? More
>importantly, what can *you* do?
>73, Jeff

something i've been meaning to check into but haven't is the section in most yellow pages describing local activities. The YP here calls 'em "Community Interest Pages". Major headings:

Newcomer Information
Senior Citizens
Fun Side
Zip Codes
Calendar of Events (things up to about 1.5 years in advance..)
Area Map
Hurricane Preparedness
Airport

Certainly local hamfests should be listed in the Calendar of Events (ours has shuttle launches in there but after a fashion, it's a bit futile...). maybe even some club references in the "Fun Side" or "Senior Citizens" sections.

>just the length of the wire not including the middle spacer.

Don't take this antenna length as gospel, make the antenna a couple
of feet too long according to the formulas, and trim to resonance.
Near field effects will cause your real antenna to vary from the
book antenna.

>And if I use a TS-520S transceiver and a dipole antenna made as in reference 1,
>the transmitter and the antenna will be matched without me having to use
>antenna tuners, and what about the SWR ?

If the antenna is matched, then by definition the SWR will be 1:1.
This won't happen in the real world, but you should easily be able to
trim the antenna to a SWR of 1.2:1 or even better at one frequency, and
expect the SWR to remain below 2:1 over the entire band. The 520 will
have no trouble loading into that.

We could swat gnats all day about *perfect* antennas, but the tunable
PI network in the 520 won't care as long as the antenna is roughly
the right length. This is one of those cases where you can measure
with a micrometer and cut with an axe. Pay more attention to getting
the antenna as high, and as in the clear, as possible.

That's what the FCC reprentative was quoted as saying in the W5YI Report.
That's the LEGAL reason they were given the NAL.

Well I think you already suspect what the problem is. You're getting
RF in the shack that's getting into the power supply and screwing with
the regulation, sometimes to the point of shutdown.

An end fed random wire is susceptable to this problem. A counterpoise
can help, as can a solid, short RF ground connection to Earth. But
the latter is slightly more difficult at your location. You might
try a "tuned" ground lead as an RF shunt, and you should take steps
to suppress RF ingress to the power supply with the usual assortment
of chokes, toroids, and bypass capacitors. Ultimately, you may have
to go to a balanced antenna, such as a dipole, to lick this problem
completely.

The ARRL Technical Department issues a call for articles for Volume 4 of the popular Antenna Compendium series.

Manuscripts should describe practical, readily reproducible antenna projects of general interest, or should describe computer modeling of antennas, transmission lines, matching networks or propagation. Mathematic or computer modeling (validated by actual measurements of practical antennas) is encouraged. Please send a detailed description or outline before writing final article to Dean Straw, N6BV, Senior Assistant Technical Editor at ARRL HQ. The deadline for submission is Dec.1, 1993. An Author's Guide is available.

NOTE: Dean does not have access to Internet at the present time. If you wish to email questions or comments, send them to sford@arrl.org and I will relay.

In rec.radio.amateur.misc, royle@tekig6.PEN.TEK.COM (Roy W Lewallen) writes:

[deletions]

>Contrary to popular belief, there is no standard for S-unit size. Here's

I agree with this statement in the sense that there is no *one, agreed-upon and liberally applied standard.* To *me*, that's the same as saying "there is no standard," because a standard that isn't widely seen and applied as such might as well not exist. (Aside: Multiple simultaneous standards make people lots of money. Check the connectors section of any electronic parts catalog!)

For the record, however, IARU Region 1 adopted the 6-dB-per-S-unit, S9=50-microvolts standard sometime ago. So, ham-politically speaking, there *is* an S-meter standard, as non-operative as it may be.

This is the only modificational comment I can think to apply to Roy's posting. I enjoy Roy's words because they lucidly and modernly second my own views and those of my friend By Goodman, W1DX, an assistant technical editor with ARRL for three decades, who wrote pithily on (among other things) the meaninglessness of S meters as absolute indicators. (His correspondent Larson E. Rapp wrote on the allied theme of the strength of signals from rare DX "countries" varies inversely with the number of active hams in those countries.)

Every time I hear someone talk about how accurate an S meter is, I hear that song line: "Trying to make it real compared to what?" Perhaps we should get back to Magic Eye tubes (but GEARVAKf showed how to install one on a TS-940S and calibrate it circumferentially in units and dB over 9...). If so, the 6U5/6G5 has greater range because it's remote-cutoff.

Remembering days when S meters went only to S9+40, I humbly submit that if maxing one of today's S9+60 meters ultimately fails to flatter, we should perhaps drive our meters still harder (another op amp can therefore improve everybody's antennas!) and give our signal reports in rpm.

>and it isn't type accepted for those frequencies. The article also
>specifically mentioned the FT530 HT which can also transmit out of
>the Ham bands right out of the box (140.000 - 150.000)

Funny, years and years ago when I bought an early IC-02AT it came out
of the box able to receive _and_ transmit anywhere from 140.000 to 151.995,
and no one said a thing.
I can't see why they'd get away with this, since it's not illegal to
own transmitting gear without a license, nor is it illegal to sell
transmitting gear to someone not licensed to use it.
Pretty soon we'll see TV manufacturers fined because the horizontal
deflection circuitry has so many harmonics that are clearly audible every
15.734 KHz throughout the shortwave bands. *sigh*

I'm glad to see FCC cracking down on unlicensed and illegal operation,
but maybe they're going a bit off the deep end this time.

Source record: 278904

>The lead article in this week's W5YI Report is the story of several

Amateur Radio Newsline also (lead was the commercial content ruling action - but it was too early to have any details).

>If it is illegal to sell these radios, then is it illegal to use them?
>Is it legal to use a radio which is type accepted for a part of the
>spectrum it covers, but not the entire spectrum it covers?

Geez, don't nobody tell 'em about things like the Collins KWM-2A/S-Line or the Drake Twins (heck, Drake even made the FS-4!). Or just about all the other rigs on the market.

The newsline tape had something in it about an "anonymous" complaint being filed. Why should the TS-50 be treated any differently than the other radios?

I can't wait for them to go close down ICM or Jan xtals because they sell stuff that can be used in equipment that will make it work on frequencies not assigned to the service the equipment was originally designed for.

I don't think the certification that equipment is in compliance with the regulations concerning spectral purity is the same thing as "type acceptance." In my reading of the rules (a fairly recent copy, though not a 1993 copy) I didn't see anything at all indicating that any gear other than external RF amps operating under 144MHz had to be type accepted to be marketed commercially..

Duane,

Boy! If this isn't the pot calling the kettle black!!!!!

All this verbage from a non-member.

First, you have a lot of very good ideas and in the last few messages you have create a basic ACTION PLAN of the steps to be taken in a proactive PR campaign. Since you have the concept and road map of what needs to be done and the passion to do it, then I suggest, recommend, and employ you to contact either HQ or your Divisional Director with your well written plan. Duane, grab this bull by the horns and lets see some PR out there!!

Second, the ARRL does not have infinite resources (money, for those of you in Rio Linda, CA. - Rush...) and unlike our government, the League tries not to bugdet money for a new program unless it is beneficial for all hams and can be supported on an ongoing basis. It does not matter what you think of the ARRL, it is still the most professional and level headed organization we have to represent us. All this made possible by the money of only 1/3rd of us. Think what could be done if 1/2 of the remaining 2/3rds would become Life members. What a wonderful investment for the young guys/gals, what a great legacy for the OF's. I am continually amazed at the amount of non-members that yearly put out $1000 - 3000 for radio equipment and can't find a lousy 30 bucks per year for membership or $675 for Life membership which can be amortized over 1-1/2 years. The same people that complain the loudest. Become a member, get involved and fix it!!!!

Steven E. Jarosh, KA0VYB
Life Member - 35 years old - Not rich yet and definitely not an OF!!

Microwavers do it with higher frequency

I love reading the articles abt RipOff Shack!!

I called the other day to ask if RS had a certain transistor. The salesdroid
said "Yes, it can be found in our cross refference.."
I said: "Could u please look up (whatever it was) for me..."
salesdroid: "Oh, I, uh, I have a line of customer waiting...but
u can look it up if u want..."
I said: "I am sitting at home, abt 10 miles from ur store, hence
I cannot look it up from here, maybe u missed that..."
salesdroid: "Well, sir, like I said I have a bunch of customers..."
I said: "Yeah...Right.." and Hung Up!!!

Perhaps that was rude, but this is not the first instance a RS saledroif has
been to lazy to help me over the phone. I once asked if they sold gell cell
batteries and the idiot said "Jello, we don't sell Jello...".

I have a whole bunch of stories like this...
But no need to tell all of them, u get the picture.

The FCC does "type acceptance" on all electronic equipment relative to
certain criteria. All commercial radio receivers, TVs, scanners,
VCRs, computers, etc have to meet various "type acceptance" criteria
relative to emissions, etc. Look on, under or somewhere on almost
any piece of new electronic equipment and you'll find a reference
to the specific type acceptance criteria to which that equipment has
been validated/type accepted.

For example, my desk telephone has a sticker indicating the phone
complies with part 40 of the FCC rules. My video monitor "complies with
Part 15 of FCC rules."

Again, these "rules" for the various equipment types are applicable to
equipment manufactured and sold on a commercial basis. The "type
acceptance" rules do not apply to home made equipment, nor are they
applicable on a retroactive basis to equipment that was made before
the current criteria was established.

Thanks to all who replied!!

I wound up using a .01mF Cap and a 1.2K Ohm Resistor. Also I discovered that a .1mF Cap and a Resistor up to about 5K Ohms will work properly with the DJ-580. At first since it was a 3 conductor plug I was wiring the PTT to the sleeve and the Mic Audio to the tip. I just assumed that I needed to use all three connections. Dummy me!! I looked at the wiring digram in the TNC manual and it had both connections made to the tip. RTFM right!! Sure enough that was all I needed.

Learning is what this hobby is all about anyway?!

thanks and 73s - Warren

|> because it can transmit out of the Ham bands right out of the box
|> and it isn't type accepted for those frequencies. The article also
|> specifically mentioned the FT530 HT which can also transmit out of
|> the Ham bands right out of the box (140.000 - 150.000)
|All the Yaesu VHF/UHF radios I've ever seen transmit out of band
|(140-150) so you're telling me my FT-5100 is illegal? I think not.

Curiouser and curiouser. My HF rig also transmits outside the ham bands; the Yaesu FT990 happily transmits the entire 500khz surrounding each ham band (I believe, I haven't actually transmitted there, of course :-)). The only special protection, apparently added as an afterthought or as an extra item, is that on the 160m band, below 1800 the radio _acts_ as if it's tranmitting, but doesn't. (There is a special note in the manual that if you try to activate the built-in tuner below 1800 it will hang till you manually turn the tuner off.) There is no apparent protection from transmitting on, say, 7.300 to 7.500, 10.000 to 10.010 or 14.350 to 14.500.

2-3 miles line of sight? That would be pretty poor.

Several years ago, I witnessed a 450-MHz FM contact from the roof of a building in Cambridge, MA to Mt. Washington in New Hampshire. The elevation at the Cambridge end was about 325 feet MSL (AGL also); Mt. Washington is 6,288 feet MSL. The direct distance is 132 miles. Given normal refractive conditions and a smooth earth, this is just within unobstructed (i.e. radio line-of-sight) range. New England, however, is definitely not smooth. Refractive conditions were unspectacular. I suspect the path was not unobstructed.

The radio in Cambridge was a Yaesu FT-709 HT with its own quarter-wave whip (or perhaps a short helical). The radio at Mt. Washington was a mobile rig with a car-mounted antenna --- a 5/8 over 1/2 at most.

There is a lot of activity up and down the coast and midwest area. 222 shouldn't be a problem. 432 is more popular and will be really hopping if the band is open. 1296 is a real challenge and my favorite band. As I remember EM86 is realitively rare so if you can get the word out people will be looking for you.

Anybody else that will be in the UHF contest, please post your grid and bands in this thread.

David-

I'm not familiar with the problem you're having, but am aware that Super Morse was upgraded to version 4.01, or possibly further by now. If you have an older version, an upgrade might fix the problem.

I bought a pair of Koss headphones six years ago. They were light, comfortable when I tried them on at the store, and cost about $70. I believe they are Pro 4/X, but I may be mistaken. After wearing them a short time, the inflated ear cushion on one side deflated. I ordered spare cushions from Koss, but also went shopping again. I ended up also buying the Sony MDR V/6 headphones, for about $70. These actually cover your ear but are snug against your ear. The quality of construction appears to be light years ahead of the Koss, the sound quality is, IMHO, slightly superior to the Koss, and the coiled cord on the Sony headphones has not, in six years of regular use, kinked up like the shoddy coiled cord on the Koss did in six weeks.

Also, while the Koss seemed more comfortable at first, they wear on you quickly. The Sony headphones are comfortable for a much longer period.

In all fairness, the Koss 'phones sounded quite good, but the quality is awful. For the same money, the Sony headphones seemed to be far superior.

Another advantage to the Sony 'phones: the word 'Digital' was on an easily removable sticker, leaving the headphones black and void of the stupid reference to digital. The Koss headphones have the word molded on.

|> name-brand stuff...

The thread that wouldn't die :-)

I had this problem too, and it's one of the reasons I think stores like Radio Shack might not _want_ someone with technical experience. For a while after being rejected by Radio Shack, I was manager of various different electronics departments in the Times Square Stores chain on Long Island. The departments were a concession operated by a local retail electronics distributor.

We mostly sold OK equipment, but we would on occasion buy re-packs and sell them as new merchandise. It seemed these re-packs were mostly defective returned merchandise that had been repaired or at least inspected, and repackaged for sale. About half of them would be returned, defective again. We'd inspect them, and the units that passed inspection were sold again as new merchandise. I figure we unloaded a whole lot of broken equipment to people who were too lazy to return the items or gave them as gifts.

Of course I'd try to steer people away from this merchandise, but they'd often get angry at me because they thought I was simply trying to sell them up to something more expensive. Sometimes, I'd tell people that another unit was much better, and they'd say "That's OK, it's only a gift".

Back then, we sold 300 Ohm TV flat-line with the various stand-offs, plastic tacks, etc. I had a hard time convincing people that the stand-offs, etc. were necessary and that it was not OK to tape the flat-line to the mast or to staple it to baseboards with the staple straddling the flat-line.
A lot of customers were absolutely sure I was lying to them.
More than once a customer told me that no honest person would claim that radio waves would go through the insulation on the flat-line, and that I was a shameless shyster out to get the commission on those standoffs. I never worked for a commission. The chain went out of business some years ago.

I finally came to the conclusion that there were some customers I could never help, no matter how good my intentions - and those customers might just be in the majority. Radio Shack is designed to serve just those people.

Bruce Perens KD6OTD - now happily employed at Pixar.

I did a test and "me too": My SM 3.16 works fine under DOS, but I also
get clicks for dots under Windows 3.1 (machine = HP Vectra 486/66ST, DOS
5.0).

But sorry, I have no solutions.

>>didn't see anything at all indicating that any gear other than external
>>RF amps operating under 144MHz had to be type accepted to be marketed
>>commercially.

<The FCC does "type acceptance" on all electronic equipment relative to
<certain criteria. All commercial radio receivers, TVs, scanners,
<VCRs, computers, etc have to meet various "type acceptance" criteria
<relative to emissions, etc. Look on, under or somewhere on almost
<any piece of new electronic equipment and you'll find a reference
<to the specific type acceptance criteria to which that equipment has
<been validated/type accepted.
<
<For example, my desk telephone has a sticker indicating the phone
<complies with part 40 of the FCC rules. My video monitor "complies with
<Part 15 of FCC rules."

As I said above, I don't think "certified in compliance" == "type acceptance".
I think "type acceptance" is a very specific term; for instance, modifying
the innards of a CB radio voids the type acceptance and makes further
operation in the CB allocation illegal, even if the mod does not result in
otherwise illegal operation. The same goes for GMRS and commercial band
radios. Theres no such restriction on user modifications to ham radios;
I think there is no "type acceptance" to void.

Source record: 278831

Is the "S meter" in the TS50 driven by the u-processor? If so, then
it would be possible, if there's enough gain consistency in the
manufacturing run, to have an accurate meter. Of course, the process
of setting this up would be expensive.

>things moving, and keep things reasonable?

Clark, I can think of one good, convincing, believable argument for
keeping Amateur Radio. IMHO, my use of an extremely small part of
the total RF usable spectrum is every bit as important as the next'
person's cellular call, TV viewing, baby monitor, etc. We hams pay
taxes, generally do our "civic duty", and are just as much citizens
as the next person. Why should we be denied use of a spectrum that
is supposed to be for the use of all? That's like saying that all
computers should be for business use -- no games, no fun, no Internet.

I think one of the first things Amateur Radio needs to do is stop
justifying its existence. It has as much right to be here as any
other service (IMHO). The fact that it doesn't turn a profit can
not be allowed to destroy it.

Source record: 278836

When our cable system has a problem like snow on the dish or anything
that reduces signal strength to the point where the decoder can no longer
receive the signal, the audio appears to switch to whatever is on the main
audio subcarrier. When CNN's signal goes kaput, one can hear a tape loop
advising you that you should contact a certain address and telephone number
to subscribe to the service. As soon as the decoder picks up a good signal
again, things return to normal. There is usually a loud burst of white
noise when the switch takes place. It is probably the audio encription
algorithm syncing back up.

5276. Mod for Yaesu FT-890

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 20:53:40 UTC
From: downsd@aa.wl.com
Message-ID: <1993Jul20.155340.1@aa.wl.com>
Source record: 278833

Am looking for mod to open up TX on Yaesu FT890. Thanks in advance.

5277. Nomenclature for TO220 Socket

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 21:06:55 UTC
From: martin@datacomm.ucc.okstate.edu
Message-ID: <1993Jul20.210655.14354@osuunx.ucc.okstate.edu>
Source record: 278838

What is the correct nomenclature for sockets that will properly
hold a TO220-style transistor? I have seen some in a Heath Kit Weather
station and would like to get a bunch of them for projects. It would be
very good if one can get them in both PC-mount and point-to-point style.

5278. Two-Line Orbital Element Sets (TLE229)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 21:44:19 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.743204659@afit.af.mil>
Source record: 278855
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

5279. Re: Lightning Bolt Quad Review

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 21:58:34 UTC
From: szb50@ccc.amdahl.com
Message-ID: <49vz02my4aQg01@JUTS.ccc.amdahl.com>
Source record: 278841

My only question is what took you so long -- stopping for drinks I
suppose. I put mine together all alone and a lot faster than I thought,
next I got the assistance of G0IVD (Pat) and we had it all up and
working on one of those rare sunny days in February, it took us about
an hour to put the elements on the boom and tighten everthing up, we
played around with tuning for about another hour, then sat in the sun
playing radio for the rest of the afternoon.
Excellent antenna, good quality parts, light and easy to put together
and to raise, my previous antenna was a boomless quad and murder to put up,
I have recommended it to my brother (KD4OKI) and hope to see him on the
air with one soon.
I understand just how you feel, JUST GREAT!

5280. Super Morse problem in Windows

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 22:08:27 UTC
From: david@bu.edu
Message-ID: <22hqcr$1ki@news.bu.edu>
Source record: 278840

I have solved the problem with running Super Morse under Windows. In order to make the dits and dahs sound right under Windows requires using version 4.04 of Super Morse. There are instructions on how to configure it in the manual (RTFM), and there is a calibrate option in the setup menu that will get the speed right. My thanks to all that replied.

The newer version is available from wuarchive.wustl.edu as:
mirrors/msdos/hamradio/sm404.zip

5281. OMNI-D Series C

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 22:30:06 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9307201529.aa23165@Paris.ics.uci.edu>
Source record: 278842
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Got an OMNI Series C today, and noticed, among all the great features, the AGC "pops" when a strong signal hits me. Anyone ever tackle this one? I don't yet have a copy of the manual, so I am not sure what the circuit is like, I suspect it is like the Triton IV, but don't yet know for sure.

Real neat radio for its time. Very fine for CW, IF and audio filtering included, and very smooth QSK.

and here in birmingham we can hit a tower in Tuscaloosa, a distance of about 50-60 miles, with my HT running on low power, about 1 watt into the rubber duck. signal reports I get are 59.

5283. Re: KC0Q/N0II CMOS SuperKeyer II

>

I would rate the CMOS Super Keyer II as one of the best of all time.
It has absolutely perfect timing, is very smooth to operate, has
a decent memory, uses very, very little power, has a very useful
command set, is extremely reliable, has a low parts count, and is
inexpensive. What more could one ask for?

The enhancements were in the firmware, something to do with the
user interface. I didn't get the new version, and haven't missed it.

Go for it!

How about "TO-220 Transistor Sockets"? :-)

>I have seen some in a Heath Kit Weather
>station and would like to get a bunch of them for projects. It would be
>very good if one can get them in both PC-mount and point-to-point style.

The Digi-Key catalog has them, made by Molex. They make both a
straight-line pin design and one that offsets the middle pin a bit.
It looks like they're all PC-mount, but you could use them in
point-to-point wiring by soldering wires to the pins and using
a bit of heat-shrink tubing.

Also, the TO-220 case was designed to fit TO-66 sockets by bending the
two outside leads and attaching the tab to the "collector" terminal
with one of the screws. Some TO-66 sockets don't like the thickness
of the TO-220's leads, though.

5286. Beginner -- Help [LONG]

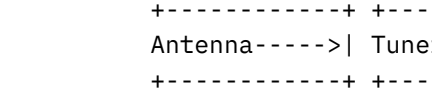
Newsgroup: rec.radio.amateur.misc
Date: 1993-07-20 23:33:41 UTC
From: bwhite@cobra.camb.inmet.com
Message-ID: <CAHLG5.HC7@inmet.camb.inmet.com>
Source record: 278847
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

Note: I am sending this note to the Boston Amateur Radio Club's email list and the Usenet groups rec.radio.amateur.misc and rec.radio.amateur.antenna. Please forgive me if you see this several times. I hope it is in the right places.

I am a (sort-of) newly minted low-code tech, and I am having alot of problems getting started on HF. I wonder if somebody can give me some direction, as I have used up all of my tiny imagination. The short description is that I am having trouble getting the transceiver to load into the antenna. (That's not the right phrase -- what is?) I am wondering if it is operator error, a really gross antenna mismatch or something wrong with my radio.

The long answer is this. My equipment consists of:
1. Yaesu FT101E. This might be an FT101EE. I don't remember right now, and I am not in my shack to check it. I bought this second-hand from someone who claimed it worked fine. I believe him, but perhaps something has malfunctioned recently.
2. MFJ 949E Antenna Tuner. (This number may be wrong. It's the one which costs around $150 and has a 300W dummy load.) I bought this new, so presumably it is good.
3. 150' of 12 or 14 gauge speaker wire (that's 75' split into two parts.) It looks to be about the same size as the 14 gauge antenna wire I bought just recently, but since it is insulated I can't tell exactly.
4. 100' of RG8/U coax. I don't know the brand, as I bought it at a fleamarket. I think this number is right. It's the size coax which uses the mumble-176 adapter on the PL-259 connector.

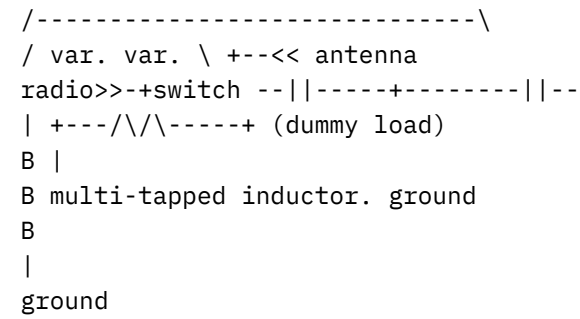
Now, I have connected the machinery in what seems to me to be the sensible topology:



The cable connecting the tuner and the radio is a short piece of coax with two PL-259 connectors. These were my first attempts at soldering these kind of connectors, and my first attempt to solder anything in twenty years, so I suspect them of being badly done. I did try to check it for connectivity, and it seemed to be ok. However, I only have a code practice oscillator to test continuity, and nothing sophisticated. I don't even have a multimeter yet, although it's on my list. That is, perhaps a bad connection is causing some large inductance which my DC tester is interpreting as a good connection,

but which the RF transmitter output sees as a big load. This seems unlikely, but I can't test for it, so perhaps it is there. A bad connection seems more likely to me to cause capacitance, which would look like an open circuit to my DC tester, right?

The tuner is essentially a T network with 2 variable capacitors and one multiply tapped inductor.



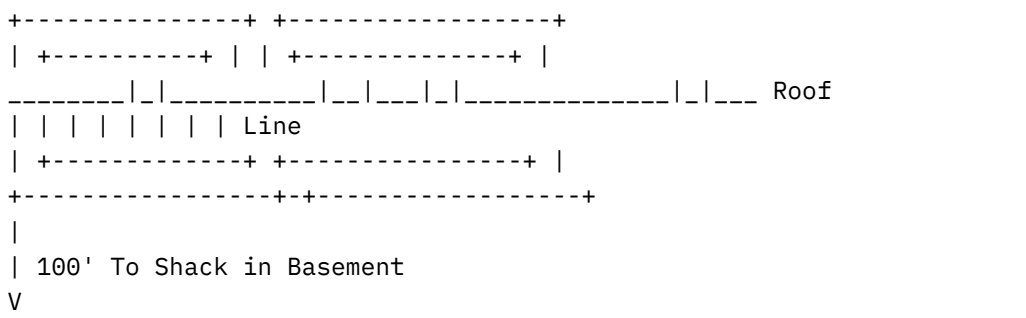
The switch has several positions:
a.) Two coax input, and one unbalanced input with the matching network switched in.
b.) The same three inputs with the matching network switched out.
c.) A 300W max dummy load with the matching network switched in.
d.) The 300W max dummy load with the matching network switched out.
There are both forward and reflected power meters (crossed needles) on the tuner, and a pushbutton switch to select between 30W and 300W maximum meter deflection. All of the following description is with the 300W button setting.

Now, when I turn the radio on and try to tune it up. The following peculiar things happen. I go through the pre-tuning process, and then start to peak the finals. These peaking process consists of peaking the power output (as read with the radio's meter) for increasing settings of the carrier control by manipulating the plate, loading, and preselect knobs. (N.B. The radio's meter is set to measure relative power output -- the P.O. setting.) However, when I switch the dummy load on with the matching network switched out I can only perform the peaking process when the carrier is 60% or so of its maximum. The manual seems to believe that the carrier arm can be moved to 100% of its maximum, but with more than 60% the power meter on the radio is pinned, and the power meter on the tuner reads 150W or so. I haven't left it on for long enough to get a good look at the tuner's meter reading, since I didn't want to hurt the radio.
Note1 The tuner's reflected power output meter doesn't move when the tuning network is switched out and the dummy load is switched in. Since the dummy load is completely resistive, this is what I would expect. Furthermore, this seems to tell me that there is some problem independent of the antenna, and probably with the radio, but perhaps I am wrong.
Note2 The loading control seems to peak when it is at the minimum

setting. Since I don't know what loading means in this
context I don't know how to interpret this. Is something
wrong here?
Now, when I try to do the peaking with the dummy load on and with
matching network switched in, I get chaos. The meter pins at 40% or
so of the carrier's maximum swing, and the reflected and forward power
meters on the tuner dance like Fred and Ginger. I get an SWR reading
of 15:1 in the 1-1.5 seconds I turn on the transmitter. This is with
the dummy load switched in, and not the antenna, so something is
clearly wrong. Neither the loading control on the radio nor any of the
tuner's settings seem to make any difference in the SWR or in the
reflected power reading.

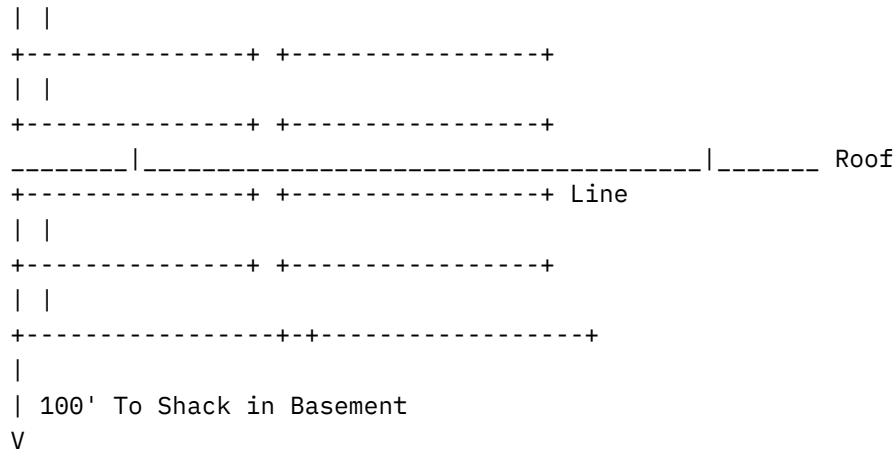
This is as far as I have gone so far. I am presuming that the antenna
is not an issue here, since I haven't even switched it in. However, I
am not sure the antenna is configured in the best way. The remainder
of this note describes the antenna -- perhaps someone can suggest a
better alternative.

The speaker wire is configured as a jumbled up dipole in my attic.
That is, the coax feedline comes up from the basement (along some
heating vents), up alongside a chimney, and into the attic. The
shield and core are connected to the two arms of the dipole. The
attic is not 150' long, it's more like 40' long, so I have curled the
arms of the dipole around. If you were to lay on the attic floor and
look up it might look something like this:



Of course the geometry is not even close to the picture.. One arm is
packed into a space about 1/4 as big as the other due to the geometry
of the house. The house is wooden with no aluminum siding. The
speaker wire is set off from the roof joists with those little
standoffs you get at Radio Shack to use with twin-lead television
antenna wire.

I have two questions:
a.) The standoffs are a loop of metal (aluminum I think, but
perhaps brass plated steel) which go around the antenna wire.
Do these look like inductors to the antenna and increase the
inductance, and make the tuner's job too hard.
b.) The antenna's arms are a spiral in. Will they work better if
they go back and forth? That is, it is better to put them
like this:



This wouldn't be all that hard to do, but if it won't make
much difference I won't mess with it.

>less then 1 mile at times. Hope this helps!

Agreed! There was one spot in town where I used to live where I could
reliably work the metropolitan repeaters about 60 mi away, using 3W into
a mag-mount 1/4 wave antenna. I later moved to that city and could not
reliably hit all the same repeaters with the same setup. Guess I had
a good "downhill" view before I moved. Nowadays I live in D/FW and I
really need about 45 Watts to do any good.

:
: /J
:
(stuff deleted/save space amd eyes)

OK...I think I see whats going on:
TS-50 is a 10mtr rig...oh say like the 25-10 , 2600, HDX-100 ?
And being a favourite of C/B ers , to re-do them down to 11, use all the
extra (to them) frills such a rig has, They were being sold TO C/B ers,
or the 'risk' that it was occurring...etc.

YES...there, then 'type acceptance' (concerning the frequency range!)
would be missing....
C/B was originally set up as a poor mans 'taxi cab radio'....a business
like radi, but useable by tiny businesses, familys...etc...and so came
under the same rules as for commercial 2 way sets.
All you had was Vol, Squelch, Freq selector and the user need not know
any more than how to use a telephone....so is way all the preset this and
thats.
C/B, I believe, is still under those rules...the sets must only run on
just the c/b freqs...no place else.
Any radio set that is used on c/b that does elsewise is NOT type accepted.

NOW...for ANY kind of ttransmitter, there is a tech requirement that it
does not spray all over the dial (spectral purity).
Hams. who build their own gear would be expected to insure their gear
conforms to those specs, and so would not have to get type acceptance.
(I assume of course , rig is used only on Ham bands , no matter how far

the dial can turn) ====
Other gear...say, factory made, would need to at least conform to the
spectral purity part.....and it looks like....because of how notorious
c/b ers are, any equip that can tune 'too close' to c/b is a special case,
RE: RF power amps....no 12/ 10 mtr coil...
25-10 like sets (yummy to c/b) that are 1 banders, easy to move 'em..
The ones too tempting / easy to put on c/b in other words.
Those then might have 'special' type acceptance.

Rigs like---oh...TS-440 and Collins and all those...being all banded,but
usually way outa sight for a c/b er to buy....are considered less of a threat
and so theres less concern, so they'd have 'type acceptance' mainly for
it's spectral purity....and not for it's freq span capacity.

Am I right? If so (or near so) then it makes sense.

All I have here is a Collins and some home brew stuff....so I can't go
look at any FCC tags on the rear! :)

(FORMERLY THE WABASH VALLEY HAMFEST)
Sponsored by The Wabash Valley Amateur Radio Association, Inc.

SATURDAY, OCTOBER 2, 1993
7 AM to 4 PM
Clay County 4-H Fairgrounds
2-1/2 Miles North of I-70 on Ind 59 in Brazil, Indiana
(Rain or Shine) This is an INDOOR hamfest in a spacious facility.

Tickets are $5. Advanced ticket sales are in effect until August 15,1993.

There will be a special drawing for holders of advanced sale tickets.
The prize will be FIFTY DOLLARS. For advanced tickets send check to:
Tickets
WVARA Hamfest
P.O. Box 81
Terre haute, IN 47808

CASH DOOR PRIZE! HOURLY PRIZES
FREE BINGO 2-M TRANSMITTER HUNTS
INDOOR FLEA MARKET BREAKFAST SERVED 7-10 AM
VE TESTING SESSION 10 AM LUNCH SERVED 11 - 2 PM

TALK IN: CALL W9UUU, 146.85 OR 444.35

VENDORS: Forty tables are available at $5 each. Some tables will have
120-V a-c power. Specify if you want electricity. Spots with electricity
will be available on a first come, first served basis at no extra charge.
All vendors must purchase a ticket.

For table space send your reservation stating the number of tables you want
and a check for $5 for each table to:
TABLES - WVARA HAMFEST
BOB NELSON WO8X
RTE. 3, BOX 223
PARIS, IL 61944
Bob's phone : 217-463-2213...(Eve); 217-465-2606 X-297...(Day)

VE TESTING SESSION: 10AM. All who come to be tested, must bring the following:
(a) Your original current ham license, (b) a copy of the same,
(c) identification with your picture on it, (d) any Certificates of Successful
Completion, (e) check for $5.60 made out to ARRL VE.

From I-70 take IND-59 exit (Brazil,Linton) north to the hamfest. There will

be signs and W9UUU will be manned to "talk you in".

For Hamfest Information, call Keith Reedy (WA9DRO), President of the WVARA.
Phone numbers are 812-466-3134 or 812-466-4899

: Warren, KD4YRN, complains that his TNC will not key his DJ-580. He says
: he tried "various values" of R & C.
:
: Warren - You didn't say what values you tried. I found that with a PacComm Tiny-2
: (quite a nice box) I required a resistor no larger than 2.7K to get my DJ-580
: to key. As I recall, the recommended value was 5K, but that didn't work. I
: didn't fool around with a capacitor, and I didn't use the recommended 3-pin
: connector (available where?), so I'm probably wasting some power by shorting
: the mike power limiting resistor to ground. But it keys fine, it runs for a
: long time on a battery charge, and the radio doesn't get very hot. Try a smaller
: pull-down resistor. (Not too small, though!)
:
: AXM
: kd1ik
==========
some radios need this:

```
mic plug o-----------------+------)(------ tnc audio line
--+ |
| |___/\/\/\_____ tnc ptt line
|
|_____________________________ tnc gnd
shield braid
```

capacitor, usually .47uf will work fine.
resistor, sometimes as low as 150 ohms!

(if it seems to want to be that low, use a 500 ohm trimpot, adj for best
over all operation)

As long as you don't PUT voltage into radio mic line (like 5 or 12 v)
you won't hurt anything in attempt to find proper resistance.

Is the tnc set up to provide equal to a closed ckt to gnd upon SEND ?

I thought this newsgroup was for talking about the hobby. But lately it seems to be a Radio Shack stomping ground.

(file cut for file size)

<been to lazy to help me over the phone.

>Maybe he had a bunch of customers waiting?

(cut here for file size)
>
>
>I presume you enjoy it when a salesperson keeps you waiting while
>he or she picks up the phone and talks to someone. I can tell you
>I don't. As far as I'm concerned the Radio Shack clerk did exactly
>the right thing and I would have thanked him for it if I'd been in
>line.

I've been working at R.S. to help me make it through school. I work at a small store so I often work by myself. As far as priority goes it's the guy that has been there the longest. The telephone always takes second priority to the customer in the store. (I know that someone has probably been shafted for a customer with a $20 purchase over your fuse, but I guarentee it wasn't me.)

As far as cross-referencing a transistor, if I'm not with somebody then I'll look it up in my catalog.

As far as my store is concerned we are somewhat of an oddball, the salesteam is composed of two amateur operators, and a fax/copier serviceman.

As I stated I hope this newsgroup returns to amateur topics instead of a R.S. slash fest.

Having read his opinion, I thought, NO WAY! Those folks at ARRL know what it's like to wait around for the government to move forward. They will move heaven and earth to get the paperwork to the FCC ASAP.

NOT!!!!!!!!

I called the ARRL VE info number, 1-800-9ARRLVE.

The local testing group sent the paperwork in promptly, by overnight mail.

The Anally Retentive Regulation Lovers hung onto it for 17-19 days!

I quote the ARRL representative,
"The laws allows both the local VE's and the ARRL to take up to 10 DAYS each."

Not only did the ARRL use it's 10 day allotment but sucked up the field VE's as well.
As you may have noticed, I am not impressed!
Their representative reminded me of how much faster and more efficient they are compared to the FCC and reccomended that I call my Congressman and ask for more money for the FCC. That, said he, will speed things up.

I am not going to hold my breath waiting for the government to speed ANYthing up no matter how much money they get.

Does anyone know what the hell the ARRL does with the license stuff?
Is it SO bloody complicated that it needs to take WEEKS?

It will probably be a cold day in hell before the FCC improves but can't we do something to help out the ARRL?

My "positive" sugestion:

If they need more people, I for one would cheerfully double, triple, or quadruple the $5.60 fee for testing if it got the damn papers shuffled expeditiously!
You can't buy a rubber dummyload for your HT for $20. What's $20 to whack 2-3 weeks off of the already interminable wait for your license?

I had made a commitment to help provide emergency communications at an upcoming event. I prefer to keep my commitments, but I don't seem to have any options this time.

There, I feel a little better now....
I'd feel a damn sight better if my paperwork was on a reasonable schedule!

I agree with the writer that this is poor handling of the situation. I took my test at a local Red Cross chapter HQ, and they sent the papers in the next day, and I got my license in just under 8 weeks. I would think that everyone should have a Red Cross building somewhere near them. Just an idea for the people reading this who have yet to take the test.

SB QST @ ARL $ARLB075
ARLB075 Board meeting news

ZCZC AG17
QST de W1AW
ARRL Bulletin 75 ARLB075
>From ARRL Headquarters
Newington CT July 18, 1993
To all radio amateurs

SB QST ARL ARLB075
ARLB075 Board meeting news

The ARRL Board of Directors met in Windsor Locks, Connecticut, July 16-17. The following is a summary of the actions taken:

The Board adopted the recommendations of its Digital Committee, and, accordingly, will seek from the FCC regulations to permit semiautomatic digital operation below 30 MHz on frequencies authorized for data emissions, outside of the proposed new subbands for automatic operation. Bandwidth of digital transmissions of such operations would be limited to 500 Hz, and transmissions would be permitted only in response to stations under active operator control. Digital operators will be cautioned to strictly adhere to IARU band plans for digital operation. ARRL will develop, through its Digital Committee, operating guidelines for semiautomatic operation.

The League will also petition the FCC to seek relief from regulatory restrictions on HF digital operations to further the amateur service's ability to contribute to the advancement of the radio art.

The Board affirmed its commitment to have the League serve as the club and military recreation station call sign administrator on behalf of the FCC on an unconditional basis.

The ARRL Friendship Award was created to encourage friendly contact between radio amateurs and the discovery of new friends through personal communication.

The League will publish a DXCC Yearbook to be distributed to active DXCC participants who are League members at no charge.

The League will petition the FCC to establish a lifetime operator license for the Amateur Radio Service.

A new Amateur Auxiliary Training Manual was approved by the Board, subject to the receipt of an updated memorandum of understanding between the ARRL and the FCC.

In response to a recommendation from its Industry Advisory Council, the Board stated its support for the concept of plug-to-plug compatibility between Amateur Radio equipment.

The Board accepted DXAC-recommended DXpedition operating practices and urged their widest practical distribution.

The Board committed League support for the FCC efforts to implement electronic filing of license and upgrade applications. The General Counsel was directed to file comments opposing any attempt by any authority, other than FCC, to provide a point-of-examination temporary operating authority.

The Board endorsed the concept of an international Amateur Radio permit, similar in nature to the international driver's license. It urged that the foundation be laid for the submission of a proposal to create such a permit to a future ITU conference.

A new Spectrum Management Committee was created to address changes brought about by new technology.

The Board affirmed its policy of seeking expansion of the 20-meter band from 14.350 to 14.400 MHz.

Chris Anziano, KD1OX, was selected as the recipient of the Hiram Percy Maxim Memorial Award for 1992. James McCauley, AB6EU, won the Excellence in Recruiting Award.

The Philip J. McGan Silver Antenna Award was awarded to Gary Pearce, KN4AQ. The award recognizes excellence in public relations.

The Board bestowed the Technical Excellence Award for 1992 upon Kenneth Macleish, W7TX, for his article, ''Why an Antenna Radiates,'' which appeared in the November 1992 issue of QST.

James Stafford, W4QO, was picked as the Herb S. Brier Instructor of the Year. Robert Murais, KC1IV, won honors as the Professional Teacher of the Year.

Field Organization Volunteers of the Year were recognized by the Board.

The Board commended the SAREX Working Group, the Johnson Space Center Amateur Radio Club, and the participating astronauts for SAREX efforts.

The Headquarters staff was commended for its efforts in eliminating the DXCC backlog.

Watch for the full story in September QST

With my stock 2W HT I can reliably hit a repeater 60 miles away if I
am on the 6th story of my building. Of course this is a really wide
area coverage repeater. Some work it from Cheyenne, Wyoming a distance
of ~160 miles.

"Co-channel" meaning on the same frequency with in hetrodyne distance?
(you hear his cw but at a different pitch)

Well, which ever, the easiest cure is to turn your RF gain down to
where you still hear the desired station, then your AGC has an easier job
and so reduces the effect.
Same so, if who you are trying to hear is so strong you get a thump-thump
like effect....THAT is pumping.
(Same can occur on SSB too)

Cure for all the above, is to turn your RF gain down....well, that what I
do anyway!

The 250 Hz filter would help some, but more towards cutting out other
noises along side the desired station...but tuning gets a bit touchy.

: | Scott Ehrlich Internet: acm_se@neu.edu |
: | Amateur Radio: wy1z AX.25: wy1z@wa1phy.ma.usa.na |
: ==
`Broadcasting', from the FCC's point of view, items 1 2 above are NOT.

W1AW is issuing bullitons , CW practice etc....which conforms to FCC rules
concerning transmitting to other Hams (The intended target listener)

Beaconing comes under the same rule concept.

In similar fashion, so same the sending of ' CQ CQ de KA1UNW ' which, if
I got no reply (which happens a LOT) , am I then 'broadcasting' ?

So same to transmit, in order to test my antenna, rig etc.

Broadcasting, like to get on and start some kind of oratory , play music
and such , with the target listeners being just about anyone, any where....
THAT is what they don't want...else commercial companies will get Ham tickets
and begin Broadcasting.....sounding like 40 meters at nite!

5303. Popular Electronics advertises perpetual-motion machine.

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-21 07:14:41 UTC
From: bruce@pixar.com
Message-ID: <1993Jul21.071441.15521@pixar.com>
Source record: 278875
Cross-posted to: sci.electronics,rec.radio.amateur.misc

If you see the September issue of Popular Electronics (which is on newsstands now) take a look at the inside front cover. It's a full-page ad for the new Mohawk Environmental Services "SWITCH-CHARGER". This amazing device allows a battery to recharge _itself_ while at the same time powering a circuit!

Yes, Popular Electronics published a full-page ad for a perpetual motion device on the inside front cover of their September issue. I haven't read PE regularly since my childhood - I knew they'd been in decline for 20 years, but had no idea they'd gone this low.

The ad goes on to say that you can get the plans for this device for just $100, check or money order only. Send it to a post office box in Springfield, MA. No phone number is given.

Funniest of all are the blurry pictures of the device: a poorly cropped picture from one angle, a very small picture at another angle, and a low-resolution blow up of the small picture! Two identical images, different sizes. The device appears to consist of a glass of ice cubes on a board with speaker terminals on either side of it. A blurry diagram similar to a bridge rectifier is drawn on a cap on top of the glass of ice cubes.

Now, obviously, PE isn't going to get paid for this ad. It's either straight fraud, in which case the P.O. box is collected from once and the con artist disappears, or it's a malicious joke on PE. In either case it's clear that nobody with even half a brain checks their ads. I'd be embarassed to be seen with a copy of their magazine after this.

>education. Was this included?

Yes.

For those amateurs who don't know how to contact
the governmental body charged with regulating
amateur radio:

"The amendment [allows] licensees to use
amateur service frequencies to ... support
educational activities..."

Listen to Westlink, they're sure to discuss it
in as much details as warranted. More detail
available from the Federal Communications Commission.

That is all.

>(Let's keep this to the FCC and I think we all understand that this is
>*theory*, not practice -- It would be nice if the govt could get citizens
>to obey the law *here* :-)

Well it depends on what you mean by "force". The FCC can certainly revoke an amateur's US license and notify the foreign government that it has an unlicensed person operating from it's country. They can levy a fine, and have a US Marshall seize any property belonging to the person in the US to satisfy the fine. They can have the person seized at the border if they attempt to re-enter the US. And finally, they *can* send in the Marines, or a DEA death squad, (via Presidential Order). That's unlikely, but has happened in Panama and Mexico, though against foreign nationals accused of breaking US law on foreign soil. That's even more extreme than dealing with US nationals breaking US law on foreign soil, but the Supreme Court upheld the action.

The Supremes have said that no one has any rights outside the borders of the US under the Constitution. So the government can do anything they like until that person has safely passed Customs and is back in the US where the Constitution applies. (Note that they have ruled that until you clear Customs you aren't legally in the US, even though you may be standing on US soil.) Even if you're in the US, they can still execute a no knock assualt with over a hundred heavily armed storm troopers, including armored military vehicles, and kill you, your family, and your friends in the process, for a possible *technical* violation of Federal regulations. Scary huh?

SMD rework is actually easier than reworking multi-layer through hole
boards. The only tools you need are a static hot air source (Pyropen),
solder paste, tweezers, and a magnifier. Trying to do it with an ordinary
soldering iron, however, will be an exercise in frustration. Once you've
learned how to do surface mount rework, you'll hate to have to deal with
through hole boards.

>2m/70cm/23cm tribanders.

They're both good. I use Comet antennas, and a neighbor uses Diamonds. The performance is nearly identical. The Diamond *may* be slightly stronger mechanically, but the Comet is available to me cheaper, and is good enough in the mechanical department. I think the Comet *may* be slightly better electrically, but not enough to matter. They're both considerably better than other base antennas in their price class.

Note, Comet makes a little cellular lookalike dual bander antenna for mobile use that is very nice. Mechanically it's very good, and electrically it performs almost as well as the much larger Larsen. It's as good if not better on 70cm, and slightly inferior on 2 meters. It's so short that a rooftop mount won't get you in trouble in parking garages. It even works acceptably on cellular phone. I use an Alinco 590 and Motorola cellphone through a Diamond triplexer with this antenna. Highly recomended.

:-) :-)

Maybe now is a good time to discuss the merits of wide response headsets, and audio chains, versus band limited units. My experience is that the band limited models are fatiguing during long sessions. Others prefer band limited audio. Note that this is somewhat separate from narrow IF filtering. It's hard to describe quanitatively, but the wide band units seem to give a more "open" sound. That's probably a result of less phase shift across the passband. What say you?

5311. How to find the answers to frequently-asked questions about Ham Radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-21 09:44:12 UTC
From: ikluft@uts.amdahl.com
Message-ID: <ham-faq-ptr-1-743247845@uts.amdahl.com>
Source record: 278877
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

```
Posted-By: auto-faq 2.4
Archive-name: ham-faq-ptr

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
------------------------------------------------------------------------

This article will tell you how to find the answers to frequently-asked
Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on
the 7th of each month. This article is posted on the 14th, 21st, and 28th of
every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the
rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help
beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP
and from e-mail servers. This article contains instructions for obtaining a
copy of the FAQ. It also contains the table of contents from the FAQ so
that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ-----------------------------------

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews
------------------
If you are familiar enough with NetNews to look through previous articles on
your system, Option #1 above may be the easiest for you. The FAQ is posted
so that it should not expire from your site's news spool until the next one is
posted. Unfortunately, some news administrators do not honor the expiration
dates meant to preserve the FAQ.
```

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, updated daily when changes occur
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, updated monthly (mirror of Buffalo)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*

Great! That's what I want it to do. Better dig out the "menu" tables
again! Once you've selected AM-FM for example, can you then select the
USB_LSB_CW with the other button?

>>This points out one minor problem I've experienced. Sometimes, while
>>pressing the up-down buttons to change memory channels, one of the

>>day, about how many dB there were in an S-Unit. Since back in the 50's, I
>>had always heard that there was no absolute standard, but most receivers
>>were supposed to be "about 6 dB" per S-Unit.
^^^^^^^^^^^^^^^^^^^^^^
Since the S-scale is derived from the dbm scale, and most receiver
measurements are made in dbm's, it is SUPPOSED to be representative
of an absolute value! It SHOULD be, as you said, about 6db/S-unit.
Actually, 5.6db is more accurate, but thats not nice and neat 'cause when
you divide 50 by nine (9 S-units) it doesn't work out without fractional
parts! Converting from the absolute value of S-9 (-73dbm), S9 SHOULD be
50uv.

As Roy, W7EL said in another note, it is difficult to maintain any reasonable
accuracy, especially considering the band-to-band gain characteristics of
the equipment. But try and tell that to the guy that owns that fancy new
XTZ glitz-box that he just paid a zillion dollars for some time! You'll
get an earful for sure! And therein lies the rub. Some guys really do
think the damn thing is actually reasonably accurate! Or worse yet,
they believe that one radio is better than another 'cause of the damn
S-meter! They think that one radio is more sensitive for example, based
on the S-meter. Good grief!

>>a ten dB pad between the generator and the receiver under test. The final
>>results were that you just can't trust an S-Meter! I found values ranging
>>from 1.6 dB, up to 13.2 dB per S-Unit.

Yup! Did you find ANY band where it was even close?

Roy added:(or was it Jack?)

>How may dB correspond to one S unit?

5.6 in absolute terms. Since the scale is referenced to the "standard" dbm values, this is what it SHOULD mean. Everywhere in the world, 0dbm means 1mw across a 50ohm load (223.5mv)! S9 is -73dbm (50uv). S1 is -123dbm. Notice the difference between S1 and S9 is 50db, or 5.6 per S-unit, in round numbers.

>Is there a uniform well defined standard?

Yes; but in practice, no. The problem I have with them is that an S-meter kinda "masquerades" as an indicator of some real, meaningful information! And some among us actually think they do! There's nothing at all "uniform" about them, altho' they may make the scale look kinda uniform most of the time. That in itself is part of the in-accuracy in the indicated value. Ever notice, that on a Collins receiver, that the scale is NOT uniform? The reason is, an attempt on their part to have the voltage driving the meter represent the actual voltage change represented by the db change. What I mean here is that the VOLTAGE change is not equal per S-unit change. Remember the theory behind the db representation? It takes a 20db change in VOLTAGE to move the decimal point, but only a 10db change in power. For example, if S9 was 50uv, 20db down would be 5uv; but 5uv would represent nearly S6! A 90% change in voltage, but only 33% in indicated S-units. The meter operates on voltage applied, so it makes sense that the scale would be made more accurate if it were not evenly divided, which is what Collins did, and why. I recall a few other rigs that did the same thing, but not the models.

>tnx es 73 de k9cun (Jack Derry)

>>Contrary to popular belief, there is no standard for S-unit size. Here's
^^
There really is, but no one cares enough to make them accurate, as you suggest below.

>>why: The S-meter generally simply measures a receiver's AGC voltage.
>>To make an S-meter have a consistent number of dB per S-unit would require
>>an AGC characteristic which is purely logarithmic over a wide range. This

This is how it's actually done. If it were not for the very wide gain variations band-to-band, this wouldn't be so difficult to do! Some of the very best available amateur equipment has as much as 35db difference in gain from one band to another, and thats where the difficulty doing this comes from. It should be easy, but the gain variations make it much more difficult.

>>isn't otherwise required for proper receiver operation, and requires
^^
??? Don't they tell us that the AGC characteristic results in some small value of increase in output, for such-and-such a change in input! If they can keep the output within 2-3db, when the input changes over 100db, it sure sounds to me like they know how to do it! And we EXPECT the AGC to

do this for us so we don't have to ride herd on the volume control as we tune up and down the band. That's what AGC is supposed to do! If they can keep the output in that range, why can't they make an S-meter just as accurate?! The answer is, they can. Imagine an S-meter that was as accurate. Two or three db worth of error, spread across 9 S-units would make them actually meaningful. Wouldn't that be different?

<<stuff deleted>>

>>so manufacturers of amateur equipment don't have any incentive to do so.

Right! We, collectively have never asked them to make it right, so they don't bother. Thats different than saying its too hard to do, 'cause its not.

>>doesn't sell rigs, so it isn't done. (I'm told but haven't verified that

5313. Standard C528A Mods.??

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-21 11:29:14 UTC
From: perry@jpunix.com
Message-ID: <CAIIKr.H21@jpunix.com>
Source record: 278695

Hello Everyone.

I just recently purchased a Standard C528A dual-band HT. I was wondering if anyone out there in cyberspace knew of any mods that can be made to this particular model to inprove performance, increase bandwidth, etc? Also, what is the name and IP address of the mods database?

<Interesting anecdotes about HT range enjoyed then deleted...>

Okay, now to extend this thread.

Having been frustrated in my attempts to hit repeaters (for very long) with my 5watt HT during my commute*, what sorts of ranges are TYPICAL for MOBILE units of, say, 25-50 watts output? I'm figuring to buy such a critter, but don't want to be disappointed when I do.

Thanks!
Steve KA2RJF/KT

* I've been using a Kenwood TK230, with a RS 2m whip on my car roof. The HT's a commercial rig I use for law enforcement purposes, and I can hit and hold our various police repeaters at 25 miles or more, but seem to only hit amateur repeaters from within a few miles (which go by fast the way I commute!). I assume the difference is some combination of
1. Police repeaters are in better locations with better antennas
2. " " themselves produce more power and therefore
reply to me more reliably
Number 1 seems more plausible, and should also lend itself to improvement by the addition of xmit power on my end. Number 2 I can't do anything about. Anybody got a number 3 explanation?

>>73, doug

Hmmmm! That's a good question, and does suggest a way that it could
be done, for sure.

How about this one? Single chip voltage comparators have been widely
used for years now for a variety of purposes in all manner of equipment
from TV's to portable CD's. Complete ADC's (analog to digital converters)
exist, with sample rates in the hundred's of khz, on a single chip. Ask
anyone that owns a CD player how good these dudes are! Even the simple
devices that drive the bar-segment displays on stereo equipment could be
used effectively to provide an output that was much more accurate than
the present S-meter arrangements. A single chip you can buy at your
local electronic supplier for less than a dollar could provide the
answer.

There are a family of chips that accept an analog input (perhaps a sample
of the IF voltage, or AGC derived from it) and they can provide discreet
outputs (single bits that represent the magnitude of input voltage); or
some of them provide 8 or 16 bits of digital info that could really do
a nice job.

In other words, there really is quite a range of technology available
that COULD settle the issue and provide a pretty accurate indicator.
Notice that even with these devices being readily available, cheaply,
they also ALL would rely on some degree of accuracy being attainable
on the consistency of the INPUT voltage. They would depend on the
radio NOT having such wide variations in gain from band-to-band, or
require some means of correcting for that on the input. That's why
I said in a previous note the problem with the accuracy really results
from the LACK of control over the GAIN variation of the equipment.

Hell, if they got that under control, the present circuits used COULD
be made to be much more accurate than what we have today, and the
S-meter could provide meaningful information. I'm convinced that
the technology available could easily resolve the issue once and
for all, but the manufacturers don't know whether anyone actually
cares one way or the other. Until they think we really WANT them
to fix it, they never will.

If the bean-counters don't think there's money in it, they'll never bother.

Source record: 278686
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

The PA-6 attaches to the bottom of the radio and the battery attaches to the bottom of the PA-6. Essentially the PA-6 is inserted between the radio and the battery. The PA-6 can be left in place if so desired at all times. There is a connector on the PA-6 to which you attach a cable going to your 12 VDC source. The 12 VDC source will charge the battery at the slow or 15 hour rate and it will provide 12 VDC to the radio at the same time.

The radio can be used without the battery attached to the PA-6. The cover can be slid on the bottom for this purpose. The PA-6 can be used to charge the battery without the radio attached also if you desire.

Hello

Since I received no replies on my question, I'll ask it again.....

I am looking for some more information about the ICOM IC-D(elta)1A
2/70/23 HT. I saw an ad about it in CQ Amateur Radio of June 1993, but no
details were mentioned, except the price (USD 1100,-). So:
1) What are the technical specifications (sensitivity, mem. channels,
freq. range etc.)
2) Is it easy modifiable to extend the frequency range, and use it as a
scanner? If so what's the freq. range then?
3) If you have one, are you satisfied with it (would you buy it again,
would you recommend it to someone else etc.)

Thanks for your time and trouble.
(Those of you who sent me e-mail for the same, don't have to reply again).
(I will post a summary on the net if you like).

I've been hearing it when there is no program audio (i.e., dead air). There's still a signal there, but no audio (typically breaks to a commercial, breaks between stories, etc.) It is NOT the high speed tone bursts of the audio sync signal, unless they've taken to morse code for syncing :). Also, the morse audio volume is just low enough to be on the fringes of my ability to pick it out from the noise.
I've noticed it most on CNN or HNN, but it has made appearances on MTV, the Weather Channel, etc. The few times I have been able to pick it out, it sounded like five letter/number groups..... Curious.

The meter isn't the problem (though I doubt anyone with any sense is shipping
.01% meter movements for S-meters). The *entire* problem is the gain
variability of each stage between the antenna terminals and the meter.

With a microprocessor-driven S meter, the calibration process would be simple:
a test rig would feed known signal to the rig at several frequencies across
each band, and would tell the microprocessor the signal strength and frequency
for each one; the micro would read the digitized AGC voltage and write it to
non-volatile memory. The cost: a few hundred bytes of ROM (plus a month of
software engineering), a hundred bytes of NOVRAM, maybe five minutes of a
technician's time to plug the rig into the test jig and unplug it when it's
done, and (of course) the test jig itself. How much would it cost (the buyer!)
per rig? Hard to tell; if the control ROM has lots of space left over, then
that part has no incremental cost, but if they have to go to the next larger
size ROM to fit this in (and when was the last time you saw a software project
come in under size and time budgets?), then they use a more expensive ROM *and*
maybe get to redesign the CPU board if this is added to an existing rig. Same
with the NOVRAM; there's likely one there already, but they might have to go
to a larger one (and if they managed to design the rig without one, well, in
it goes). Test time is expensive, but if this was combined with other factory
checks, it wouldn't be so bad; the test jig, if it is to have meaningful
accuracy, is probably $1000 worth of parts and $10,000 worth of design time.
All told, it would probably cost the buyer a couple of hundred (assuming a
cost to the manufacturer of $25-$50 per rig and the usual healthy markup).

Now, how many hams would REALLY pay $200 for the knowledge that their S-meter
REALLY measures received signal strength for the two weeks it takes the radio
to drift out of spec? Think any manufacturer will believe they'll recover

their engineering costs?

Increased integration in rigs will eventually reduce the parts cost somewhat, but even then the fixed cost of design engineering, testing, and test equipment will still dominate. I think it's unlikely you'll ever see a really accurate S-meter again.

However, all is not (quite) lost. Perhaps this is an ideal niche to be filled by a QST construction article. In the past, there have been highly sophisticated construction articles that offered rigs that could surpass commercial rigs at least on the issues the authors really cared about. Perhaps it's time for someone to devise a constructable radio that could offer features like this, along with an open enough chassis to allow for experimentation.

Hmm. Anyone know if Qualcomm DDS chips can be bought in single quantities?

: >Since I don't have enough surface-mount handling tools to do anything
: >but _remove_ components (and that with some trepidation), it's just
: >as well that they did it.

: SMD rework is actually easier than reworking multi-layer through hole
: boards. The only tools you need are a static hot air source (Pyropen),
: solder paste, tweezers, and a magnifier. Trying to do it with an ordinary
: soldering iron, however, will be an exercise in frustration. Once you've
: learned how to do surface mount rework, you'll hate to have to deal with
: through hole boards.

There is a company that sells a very nice soldering iron station and
has tips available for removing most every kind of SMT part. The price
involved would be way too much for home use though.

We use these irons and tips at work for SMT repair instead of hot air.
It seems that the hot air method, if uncontrolled, can result in partial
reflows of adjacent solder joints. This can sometimes cause long term
reliability problems.

5326. Recharging alkaline cells

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-21 15:01:55 UTC
From: HWells.El_Segundo@xerox.COM
Message-ID: <"21-Jul-93..8:01:55.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 278693

Sorry for the late contribution to this subject, but I'm about a week behind in reading my E-mail.

Several years ago I performed several experiments with charging techniques for alkaline PRIMARY CELLs. All of the results were NEGATIVE when compared to recharging cells such as NICAD.

In primary cells, one of two electrodes is consumed as energy is released and the process can not be reversed by a charging technique. What I was able to determine was that a pulsing DC charge tended to remove or temporarily displace gas bubbles exposing a greater electrode surface. The result of the "recharging" was an apparent rejuvenation of the cell. But the life of the cell, at a specific current drain as compared to an "uncharged" cell, ended up being the same. In plotting the discharge curves for each of the cells, the "recharged" cell exhibited a small lift in the voltage curve at the point of recharge, but the drop-off in the curve that followed was characteristic of a NICAD at discharge - a sudden drop with the termination point of the recharged cell being equivalent to the uncharged cell.

During the experiment, I also tried using a steady state/constant current charge. The results were very conclusive: EVERY cell that was recharged began leaking electrolyte within a matter of hours. The charge current values were varied, actually decreased as the experiment evolved in an attempt to find a current value that would not cause the cell to weep. Even a 1/2 ma of charge current on a AA cell caused weeping after a time period.

The conclusion of my experiments was that there was NO ADVANTAGE in attempting to recharge alkaline cells. In fact, besides being a waste of time, the leaking electrolyte caused severe damage to my "charger" and workbench. Fortunately, I did not have a cell explode as was reported by others during this discussion.

I too am awaiting my license and would like to hear from the ARRL their side of this discussion... I am hoping to get one of the few remaining 1x3 calls in region 0. I am going to be extremely upset if I miss getting one of these calls and find out that the ARRL took that long. The VE told me that they mail it to the ARRL and then the ARRL processes it and Fedex's it to the FCC THE SAME DAY RECEIVED. If they are sitting on it for 18-20 days, why bother Fedexing - save the money and HIRE FASTER PEOPLE! Or at least tell the VE's the real story!

ARRL - what's the real scoop? Please answer here rather than email - it seems that inquiring minds want to know...

The City of Novato CA, according to a realtor I spoke to, has a 12 FOOT height limit on antennas. Above that height you must pay I believe a $500 application fee for a public hearing. There is no guarantee that your application will be approved, even if it is for a modest antenna.

Needless to say, I didn't take a job in California. This WAS a factor in my decision. I work in the State of Washington instead and live in the County where there is a 35 foot height limit, but you can higher provided you have a one foot setback from the property line for each additional foot higher. That seems pretty reasonable.

And is ham communication valuable to my community? You bet! At my last QTH I was on the Board of Directors of the Search & Rescue unit where we relied on ham comms! I was also an AEC and I'm doing the same kind of ARES and RACES stuff at the new QTH.

>
>For example, my desk telephone has a sticker indicating the phone
>complies with part 40 of the FCC rules. My video monitor "complies with
>Part 15 of FCC rules."

Complying with regulations and being type accepted are two different things, and it is important not to confuse them. Type acceptance is a certification granted by the FCC when a manufacturer provides data to the FCC indicating that a design complies with the relevant standards. In ham radio, only external power amplifiers capable of operation below 144 Mhz require type acceptance.

Nomenclature on a device indicating that it complies with relevant standards is not the same as type acceptance. Most new electronic equipment today is marked that is complies with Part 15, which is to say that it does not produce illegal undesired RFI. Telephone devices are certified to comply with Part 68. All devices must

comply with relevant technical standards, and may be marked to
indicate which standards these are, but this is not type acceptance.
Certification of standards compliance may not involve the FCC at
all.

Type acceptance really means "this device has been approved by the FCC
for use in a particular service".

|
| I'm glad to see FCC cracking down on unlicensed and illegal operation,
|but maybe they're going a bit off the deep end this time.
|--

Well last time I read the part of the regulation that covers CB it was
apparent that if you did not have a valid Amateur Radio License then it
was illegal to own non-type accepted CB equipment, or an amplifier
capable of amplifying CB frequencies. The regulation specifically states
that possesion is considered evidence of use.

I wish the rule were ammended to allow licenced Amateurs the privelege to
use 11 meters (as secondary users, of course) also allowing them to
contact other legitimate users of those frequencies. (In other words
I think that it is really silly to have to have two radios in the car
to work 10 and 11 meters. If the TS-50 can do both, why not allow it
to do so if the user is a licenced Ham as long as he abides the 4 watt
pep rule etc? Scenario--You are traveling cross country with relatives.
They are not licenced hams but do have CBs. Why should you not be able
to stay in touch simply because you have a license? Or why should you
have to have two radios installed when one would do nicely?) Couldn't
some reasonable agreement be worked out here?

I suppose you think the VEC is there to process just your application. Do you know how many they receive? I think they are probably quick enough in average times; but they are subject to peaks just like anyone else, and it's possible that when the mail brings in several large VE sessions' worth of applications at once it takes more than a little while to get through them.

I don't know if an hour per application is reasonable, either; there is a lot of careful checking and logging that goes on, and they go through every piece of paper that comes with each 610 and VE session; session logs and summary sheets, and for each 610 there are photocopies of existing licenses and CSCEs, the graded test sheets, and new CSCEs issued.

On the other hand I read the rules to mean that 610s should leave the VEC for the FCC within ten days of arrival at the VEC, regardless of how quick the VE team was.

I haven't looked into the "allowed length of time" that the VE and ARRL can hold the application. If it is 10 days per section, then I can't see any excuse for the ARRL holding on to the application for over 10 days.

Also, while I'm getting my 560 cents worth in, they should have a sorter that sorts between NEW licenses vs. upgrades. Those who are upgrading can use a temporary call on the air, while those who are new hams are "back quiet" for 2-3 months. NEW licenses should get priority to help push them through the system.

But as I rot for the next few weeks (working on number 5 now) I learn as much as I can about antennas, equipment, t-hunting, and ham etiquette.

Huh? How can the height above ground affect resonant frequency? Should
not the resonant frequency be determined only by wire length and velocity
factor? Or does the variation in radiation resistance caused by objects
in the near field of the antenna *change* the velocity factor?

>
>Again, the SWR you end up with depends on the particular installation.
>An infinitely-thin dipole in free space it about 73 ohms, which would
>give a 1.46:1 SWR (with 50-ohm coax) at resonance. However, fatter

>get a pretty good match.
>
This I understand, but SWR has nothing to do with resonant frequency.
I was experimenting last weekend with a 2-meter colinear antenna, and found
that the best SWR (measured between radio and coax) was achieved at the
high end of the band, even though the actual resonant frequency (measured
using signal generator, scope with probe at feedpoint, and frequency
counter) was below the 2M band by 1 MHz or so.

I have directed followups to rec.radio.amateur.antenna.

Can you guys say W5YI???

I'll bet you can now! :) Unfortunatly most of us have learned the hard
way that you don't want an ARRL VE to be involved in your upgrading, or
initial licensing......

And just think!!! They're going to take over some of the licensing
aspects..... hmm, I hope no one want a club call for the next decade or
so...

I recently purchased an NEC Ultralite PC1701 laptop at a hamfest, and have some questions about it. (I've been trying NEC toll-free support, but I've been put on hold for greater than 30 minutes).

1) With the laptop turned upside down, and the back facing you, what is the polarity of the three pins on the 12 volt connector the main battery connects to (call them pins 1, 2, 3);

1a) If connected to a 12v source, which pin should connect to neg (-), and which pin should connect to pos (+)?

2) Might anyone in netland have any manuals for the unit (or even any technical specs) which I could get a copy of?

I have placed a similar message in the appropriate comp.sys.ibm.pc.* groups, along with having joined the PC170x mailing list.

Thanks much for any info.

In response to Bob Myers KC0EW post where he says a mixer must have a non-linear component I respond:

Q: Where is the non-linear components in a doubly balanced diode or Gilbert cell mixer?

A: There aren't any (well there isn't supposed to be any :-). The mixer operates by virtue of its switching action. The output is the product of the two inputs. In the case of the Gilbert cell mixer the output really is A x B over a very wide range. For the diode DBM you need some drive to switch the diodes on an odd making the LO signal roughly a square wave with amplitude +1 and -1. Which is why they need a reasonable amount of drive so you keep the diodes OUT of their non-linear region so as to get good IMD performance. This is why diode DBMs have superior IMD performance to conventional square law mixers (which is what you describe in your post), and give even better IMD performace when driven by a sqaure wave rather than a sine wave. The same math works just as well for this type of mixer as the square law mixers you describe, except that you concentrate on sin(At)*sin(Bt) or more correctly for square wave drive the second term has to be the sum of all the odd harmonics (n) weighted by 1/n.

This is what I mean by a "linear" mixer or a product detector which outputs a value proportional to A x B.

These mixers avoid the "close in" distortion problem you describe.

5349. Replacing ICOM 271/471 Ram Batteries

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-21 23:47:38 UTC
From: johnm@weitek.COM
Message-ID: <1993Jul21.234738.6047@jetsun.weitek.COM>
Source record: 278721

I am concerned about the longevity of my Icom 271/471 internal batteries. These have an unknown age. I have been told that these can be replaced by first temporarily connecting a new battery in parallel with the existing one, removing the old battery, fitting a new one, and finally disconnecting the temporary one. Has anyone had any experience with this maneuver ? Sounds scary, but theory says it should be ok.....

John Mcleod N6RCD.

Yes, there is. There are several. If you buy a DX callbook,
they are in the back. They also appear in various ARRL publications.

These are the books that any amateur should have in his
library.

Touche'! Why should a phone caller be given priority over people who
are actually standing there in the store?

One of my pet peeves is being ignored in a store because someone has
called on the phone -- some people give _instant_ service to phone
callers, but almost no service to the people who are actually shopping
in the store!

As an Extra-class operator, do I operate under the Canadian segmentation (or the lack of it), or am I still constrained by the American band segments? How do the other license classes translate to operation in Canada?

I'm pretty sure it all boils down to one simple rule: you can operate in Canada on any frequency and mode you can legally use in the US, and no more.

(1) The Canadian bands are basically the same as in the US. (Are there any differences at all? I haven't really paid close enough attention to the details of the US bands lately.) There is no subbanding (at least, not in the legal rules).

(2) Foreign hams in Canada who can do CW at 12 wpm or faster can use any mode in any band. This would cover US Extras, Advanced, and Generals.

(3) Foreign hams who can do CW at 5-11 wpm can use only CW below 30 MHz. This would cover US Technicians (with code) and Novices.

(4) Foreign hams who can't do CW at all can't operate below 30 MHz. This would cover US no-code Techs.

(5) As stated earlier, you also have to abide by US restrictions (band plan stuff, etc.) in addition to the above.

For all the gory details, contact an office of Communications Canada and ask for a copy of their publication "RIC-25". The Communications office here in Kitchener, Ontario (west of Toronto) is (519) 571-6610.

According to a Canadian DOC circular dated 1983 (I really must get a copy of
the current rules! :-)):

"<a forgien amateur> shall use the call sign, radio frequencies, types of
emissions or mode of transmission he is authorized to use in his own country,
if those frequencies, types of emission, or modes of transmission are
authorised by these (Canadian) regulations."

So - you are limited by both your regs and band limits, and ours.

I recall several years ago that there was some attempt to change this slightly,
to allow European amateurs to use all of our 2 metre band, although they would
only be permitted to use half of it at home. I don't know if this was legally
changed, but I have heard some europeans on the 146-148 area.

I have used several of the Koss "PRO" series headphones
over the years. They are overrated, and not very good mechanically,
especially for something that supposedly is used by radio stations, etc.
The vinyl of the ear cushions will harden from contact with
the oils in your skin. The vinyl strap that goes across your scalp
broke on my current set, plus you get a crinkly sound from one
of the diaphragms when you push that side of the headphones against
your head.

Such an open loop system is the hard way to establish reliable system
gain characteristics. Professional color camera systems have a similar
problem. They have to maintain a given gain response under all environmental
and aging conditions in each channel in order to maintain proper colormetry.
That's done by taking an attenuated reference signal and injecting it into
the preamps and adjusting the system gains so that the signals come out of
the RGB channels at the proper amplitude. This CAL pulse is similar in
concept to the frequency calibration markers in use in radios, except it's
an amplitude reference rather than a frequency reference.

It should be relatively simple to implement a log stepped amplitude
reference in a radio and have the radio automatically insert and

measure this reference at each band change, or power up. That would give it a self calibration check that would compensate automatically for variations in stage gain.

Yes, but it's relatively easy to control the hot air flow. There are
two methods generally in use. The first is sheet metal shrouds of
various shapes to direct the air. The other, and the one I prefer,
is to use modelling clay to build a heat dam around the part to be
reworked. The clay is easy to apply, peels right off when done, and
is reusable.

There *are* pirate signals on the satellites. Some hug the transponder
edges, some hug the edge of existing signals. They're difficult to
identify and track down if they remain low amplitude and hug next to
an existing wideband signal. Spies? Who knows.

To prevent unauthorized illumination of transponders, the FCC requires
uplink stations to include ID information in their signals. For our
TV uplinks, we include our callsign in the vertical interval. Others
may use Morse on a subcarrier. But what you're hearing may well be
pirates. A couple of times I've seen narrow band signals remain on the
transponder for a few seconds after we shut down an uplink.

:
: Complying with regulations and being type accepted are two different
: things, and it is important not to confuse them. Type acceptance is
: a certification granted by the FCC when a manufacturer provides data
: to the FCC indicating that a design complies with the relevant
: standards. In ham radio, only external power amplifiers capable of
: operation below 144 Mhz require type acceptance.
:
: Nomenclature on a device indicating that it complies with relevant
: standards is not the same as type acceptance. Most new electronic
: equipment today is marked that is complies with Part 15, which is
: to say that it does not produce illegal undesired RFI. Telephone
: devices are certified to comply with Part 68. All devices must
: comply with relevant technical standards, and may be marked to
: indicate which standards these are, but this is not type acceptance.
: Certification of standards compliance may not involve the FCC at
: all.
:
: Type acceptance really means "this device has been approved by the FCC
: for use in a particular service".
:
: --
: * Dana H. Myers KK6JQ | Views expressed here are *

That all makes sense, 100%.

But the Hams rigs would have SOME kind of sticker, that was about
its spectral output....not about it's freq range.
hams are expected to know their limits as to frequency, how to control
their rigs. (c/b er and taxi drivers are not , so the rigs they use
must be able to work, foolproofly, and so have a tag to indicate the
FCC accepts it)
So, a rig that is intended to be used by a Ham, would not need any
such [frequency related] type acceptance.....

Or has that changed now too?

I'm more curious about this than worried about it...as I'd never buy one
of these new sets....you ever look inside one ?
They have PC boards with coffee ground sized capacitors, resistors and
specks that are transistors.
When it breaks....you have no choice but to send it back to its maker.

No WONDER we are 'appliance users' 1 :)

>concrete pads) do not allow this occur quickly enough to prevent
>strikes without proper preparation.

I hate to disagree with a supporter, but static dissipation arrays
are notoriously ineffective. Your ground system has to be able to
conduct the *strike* current safely into the Earth to prevent lightning
damage. The FAA did exhaustive tests on dissipative systems and found
that none were really effective. The Ufer ground I described *is*
capable of handling strike currents if properly installed.

> Thought experiment - how big of a conductor would you need to conduct a
>1000-10000A lightning bolt?

Not as big as you might think. Number 4 copper will do, or 3/4 inch
rebar. The current only flows for milliseconds, and the voltage drop
across the conductor is small compared to the bolt voltage, so the
power dissipated in the conductor is relatively modest.

>>>The one thing concrete is
>>>*not* is a good insulator to lightning surges. As a general rule, you
>>>should always use conductors in concrete tower bases, rebar will do,
>>>as part of your ground system. See my posting about Ufer grounds for
>>>details.

>>>Gary
>
> and as Gary stated, all bets are off when lightning strikes. You need
>to provide a good static dissipation path to prevent strikes - which
>the Ufer grounds (if properly prepared) would help provide. The problem
>with this kind of ground for towers is that the surface contact area
>is not large enough in a tower pad to provide a low resistance path to
>ground (my guess).

See above about static dissipation. You need about 200 square feet of
surface contact for a Ufer ground to safely *solely* conduct a strike's
current to Earth. That's contact between concrete and Earth. Inside the

concrete, you need enough contact between the conductors and the concrete to couple the strike current to the concrete. That requires at minimum a total of 20 lineal feet of embedded conductors. If you don't have that, you need additional grounding systems such as strap connected ground rods, or ground radials.

Don't count on static bleed to create a "safe" zone of space charge around your antenna. It generally won't. You must engineer to accept full strikes and conduct the currents away safely. The reason Ufer grounds work is that concrete is a better conductor than most soils. So it acts to spread the energy over more soil than a driven rod alone can. This is a sheet resistance problem, and the more contact you can get, the lower the effective resistance of the connection. Obviously, a solid block of metal the size and contact area of the concrete would work even better than a Ufer ground, but a Ufer ground, when done right, works better than just the embedded wires alone would if buried directly in soil.

According to Roger Block in _The Grounds for Lightning and EMP Protection_, there have been no documented cases of concrete spalling in properly installed Ufer tower grounds. Certainly in almost 30 years of professional service I've never seen a case of concrete spalling attributable to a Ufer installation. I *have* seen lots of concrete spalling, but in every case the concrete was not properly configured as a Ufer ground.

: Jim K5YUT
:

I can't recommend any particular NEW rig, but the HW-8 I had was a lot of
fun.
I also used a Meissner Signal Shifter (about 3 watts after cleaning up
the signal) for a while, then an AT-1 Heathkit , 1st at 16 watts but then
using a 1000 ohm kathode resistor , I brought it down to 3 watts abouts.
One day , JUST to see if I could be heard, I took a vfo(7mc) and added a
buffer stage...using a 2N3904 transistor (normally a Receiver IF amp),
and coupled it to the antenna (42 foot wire and series condenser to res-
onate it).
Using standard QRP tricks, I got someone!
After the QSO, I measured the output: 0 on the meter's 10 w scale, so I had
to use the scope......35 milliwatts!
I got 3 more stations after that. I was flabberghasted.

YES! QRP will be fun! 80m by nite, and 40m by day.

Yes, you probably were rude. What makes you think that YOUR phone call
is MORE important than the line up of customers that made the effort to
drive out to the store? At best, BOTH the customers AND your phone call
were equally important.

You should have suggested that the salesclerk call you back when the line
up of customers is down to a managable level. Or the salesclerk could
have suggested it as well.

You accomplished nothing but waste your time, the salesclerk, and lets not
forget the customers that were waiting in line at the store.

>
>Electronic Specialists in Wilmington, NC, performed the full range of mods
>on my W2A for about $55 (2 years ago).
>
>73, Gary KN4AQ Raleigh, NC

The mod (not mods) to my W2A was done for free, by an xtra who knew
"how" to work w/surface mt. parts...just the same, I beleive after watching
him that I could've done a better job: he smeared the white heat conducting
grease that's betweem the finals and the case around a bit, and when I asked
him if he planned on using silver-based solder (the standard for surface
mount components) he says "nah, ya don't need that stuff."
I provided the copy of the mods file I ftp'd, and watched every move he made,
having to "tutor" him on how to open the case (he tried pulling off the
control knobs on the top, and started to unscrew the rings that hold them on
w/a needle-nosed plier--before I said "gee, it looks like you open the case
via the screws on the sides...)"

With the detail of the archived mod file,
anyone who has a very small soldering iron (or mini hot air attachment for
their butane iron), silver solder, some tweezers, the two diodes
(ordered from ICOM, as per the mods instructions, all of ~$3,00), a
jeweler's set of screwdrivers for removing/replacing the back, a loup
or magnifying glass on a stand, and the instructions, could do it.
Unless they have a handicap that affects their vision, motor coordination,
or thought processes. Total cost: ~$40, including the propane iron and
silver solder, which you then own so you can perform the mod for someone
else (maybe for $55?).

I said mod, and not mods, because we're discussing the hardware portion, right?
The software portion is just the correct combination of keypad manipulation,
which were provided by the store I bought it at.

If you happen to know just what that outfit did for their $55, and it was more
than removing one diode and installing two--all of the same value--I'd like
to hear about it.

73,

Michael

>
Gary
>
I totally agree! The design of the audio stages of a ham radio is just as
critical as the design of hifi audio systems. My two pet hates are clipping
and frequency non-linearity. Clipping (or speech processing) normally sounds
horrible. Proper RF speech-processing I can just about accept, but the usual
two-diodes-back-to-back is probably the most disgusting device you can put in
the audio signal path.
Non-rectangular frequency response makes the speaker sound like Donald
Duck... its often not possible to determine the gender of the speaker as
a result. This is made far worse if you insist on using the cheap $0.50
loudspeaker built into most rigs. Try plugging in a proper hi-fi speaker
or professional quality headphones, and be impressed. Throw away that
cheap microphone and spend $150 on a studio-quality cardioid mic. instead;
the people listening to you will notice the improvement.
And why limit bandwidth to the usual ham 'communications quality' of
300 to 2700Hz? Specially on VHF (and 10 meters?) where theres plenty of
spectrum to go round.

In days gone by, hams used to be proud of their audio quality; some used to
achieve near-broadcast-quality (in the AM days). Some of us can still transmit
properly shaped audio with sensibly wide bandwidth (7.5KHz) when occasions
allow it. Has anyone tried Dolby-style intelligent processing on VHF? Stereo?

Sorry, no solutions here either. But maybe some insight. It is not easy
to get accurate timing info on a DOS machine. Remember that, at least for
now, a PC running Windows is still a DOS machine underneath - it just has
some pretty makeup.

Most timing functions provided in popular programming languages (i.e. Turbo
C) rely on the timer interrupt which occurs something like every 18 ms
(working from memory - not sure, but close). This is OK for many things,
but you would be surprised how bad CW with even slight timing sloppiness
sounds. As a result, programmers might have to do some pretty ugly stuff
to get accurate timing. This ugly stuff probably won't be too portable or
robust. Sooo, when you run it under Windows with its pseudo-multitasking,
the timing mechanisms no longer work correctly.

Just a thought.

My Kenwood TS-440 service manual specifies that the S-meter should be calibrated for 50 uV input at 14.200 00 MHz = an indication of S9. That seems to be somewhat of a defacto standard. Most meters seem to inidcate about 6 dB per S unit. I do notice, however, that the sensitivity of the meter varies per band on my receiver, so it is still a relative indication. To much emphasis is placed on S meter reports.

My TR-751A indicates S9 when fed 1.0 uV at 148.000 MHz, a suspiciously round number. I don't have the service manual, but determined that empirically by attaching our service monitor. The meter is approximately 6 dB per unit, but only approximately.

I told folks locally that they should go ahead and replace the RAM batteries in their older rigs, even wrote an article about it for our local club newsletter. But, like the cobbler whose kids go barefoot, I kept putting it off myself.

Sunday I turned on the trusty old Icom 745 and all the display lights came on at the same time and it beeped once and nothing worked. Uh-oh.

Shipped it to Icom yesterday. Had to pay $35 at the package store for box, peanuts, packing and shipping (ouch!). I don't know Icom's hourly rate, and there will be postage back. Bummer.

: is reusable.
: Gary

The clay is an interesting idea. Hadn't heard about that one.

Basically I just wanted to point out that liquefying the solder on
adjacent parts wasn't a good idea. Especially if there are SMT parts
on both sides of the board :-).

>how quick the VE team was.

Thanks, Joel. You've hit the nail on the head.

We do have peak times here at the ARRL/VEC. One is routinely
April/May/June--with November and December also a peak, but to a lesser
degree.

Given that a VE Team may up to ten days at their end, add on three days
(on average) for mailing to the VEC, and assuming that we took our
full ten days, two to three weeks time can be involved before the
application reaches the FCC. During testing peaks, we have had to use
our full ten days.

And yes, each answer sheet, code copy sheet, 610, CSCE (previous and current),
and any other document(s) for each applicant are reviewed. Nearly each
license copy has to be trimmed and attached to the 610, as the FCC requires.
Attendance averages twelve applicants per session, with a routine number

of sessions including 25 to 40 applicants or more.

A file is then created for test forms. Session summary results are entered into a computer. The VE Team's credentials are verified. An FCC summary form is created/copied for forwarding/filing. And so on...

Year around, we probably average four to six days processing time. Sometimes more, per above, and sometimes less. As for us turning an exam the same day received, we'd like to do that--but we aren't able to do so at present. Of course, whenever the FCC goes beyond six weeks themselves, one-third of our staff find themselves answering inquiries from applicants regarding the whereabouts of their license. This is often six to seven weeks into the process. We would be glad to have those staff members processing sessions too...

Informationally, we have given each ARRL VE Team (and VE) an information sheet--that they are to hand out to applicants--which covers the typical wait for a license (specified at about ten weeks from the test date). We verbally indicate eight to ten weeks to callers.

The FCC quotes 90 days. If an inquiry is made by an applicant to the FCC before 90 days have elapsed, the FCC will sometimes advise that the caller check back at 90 days--or, if the license has not been issued, they will review their computer records and, if nothing is found, they will give their *standard* response, "We have no record of that application!"

Great response, eh? Well, the FCC only records on their computer the fact that an application is at their facility when it is actually keyboarded.

When is it keyboarded? The 2nd to the last step in their process--which is on a Tuesday (about five to seven weeks after they have received).

What is the last step? Two days later (the same week, on that Thursday), the license is laser printed and mailed. You then receive it via first-class mail within the next few days.

Some European countries do it right in their own regulations, and restrict 2m to the 2 MHz in ITU Region 1, while giving it the full 4 MHz in Regions 2 and 3. A ham from a country with regulations phrased that way would have no problem.

Also, the Ministry of Communications really has no interest in enforcing the regulations of the ham's home country, so as long as the foreign ham is operating VHF or higher and in compliance with Canadian regulations, the question is nearly moot.

5374. DXCC field checking at Manchester convention

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-22 14:17:16 UTC
From: ginsburg@wa2cjt.wellfleet.COM
Message-ID: <9307221417.AA15721@wa2cjt.wellfleet>
Source record: 278819

I'm heading to the ARRL Convention in Manchester, NH this weekend and have a
few questions regarding the DXCC field checking operation that will take place
there:

1. What day(s) will cards be checked?

2. I just recently received my initial mixed award (101), and in the
mean time picked up enough cards for my 125 endorsement. Can I
bring my cards to Manchester to get checked for 125? Is there a
fee? (I think the answer is no because this would qualify as my
1 free submission in a calendar year)

3. I heard a rumor that someone from the league DXCC desk will be there
so that cards that are not normally allowed to be field checked
(like former Soviet republics) will be permitted. Is this true?

Thanks and 73,
Scott

Ahem. Please don't speak for me or the rest of us that have upgraded or
got our initial licenses through an ARRL VE session and have had absolutely
no problems, no unusually long waits, etc. For us, the ARRL VEC and the
ARRL VEs themselves have done just fine.

I've been working as part of the Wellesley Amateur Radio Society VE team.
We're an ARRL VE team, we put on well run sessions, and the folks at ARRL
VEC do a good job at their part of it. ARRL VEC has never screwed up anything
with our sessions and the time it takes our examinees to get their licenses
seems to correlate well with the times reported on this discussion group.
So, now what? Some people report problems and I've just reported success.
Sounds pretty normal to me.

Douglas, if you have proof of your "most of us learned the hard way"
statement, then provide it, otherwise please don't waste net bandwidth with
the same old ARRL bashing I've heard for 20 years now. Like most things
in life, the ARRL is not perfect, but they do a pretty good job and for
the ARRL bashers: they're the best we've got.

>Can you guys say W5YI???
>I'll bet you can now! :)

I'm sure that W5YI-VEC and W5YI VE teams have their successes and problems,
too. Is the W5YI system perfect? I doubt it. Is it better than ARRL's? I
don't have any reason to think either one is better or worse.

>And just think!!! They're going to take over some of the licensing
>aspects..... hmm, I hope no one want a club call for the next decade or
>so...

Oh, really? I know that the ARRL has offered to do something with regards
to military and club license, but I wasn't aware that the FCC said yes to
any of that.

73,
Scott WO1G

5378. Seek donations for Propagation Generators

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-22 15:09:44 UTC
From: lairdpg@lub001.lamar.edu
Message-ID: <1993Jul23.080944.2769@lub001.lamar.edu>
Source record: 278587

The 20 and 15 meter Ham Radio bands will be down during the weekend of July 24th through the 25th. It seems as if the propagation generators have been going on the spur again. According to the Engineer in Charge of the Propagation generator Center in Washington, D.C., The multi-converters are not asorbing the sun spot neutrons and as such, they require adjustment. The last time this happened, no action was taken and the 20 meter band caught on fire and also spread to nearby bands. This resulted in a loss of some radio spectrum to amateur radio operators. So, if you are sending or saying your CQ's this weekend, just remember, the band is down for repair. The Engineer did say however, that the band should be back up early Sunday evening for those individuals who just have to make contact this weekend.

> Gilbert cell mixer?

Kevin, you misunderstood my response; I did not say that the mixer had to have non-linear components (although any that I can think of *do* - your example requires diodes, which are the classic non-linear component!), but rather that the output could not be described by a linear equation. THIS is the consideration which determines whether a circuit is "linear" or "non-linear."

The output of a mixer is, as you say, the product of the inputs; it is therefore not describable by an equation of the form Vout = AVin + C, where A and C are both constant (in other words, the equation of a line). Any time you see something that operates by virtue of switching action, you can be pretty sure that the circuit in question behaves in a non-linear fashion.

You can also confirm this by considering what the output of the double-balanced diode mixer looks like relative to the two inputs in the time domain; one input creates the "envelope" of the output waveform, but note that its own original waveform is distorted by the sampling action of the diode switches (you can view such a mixer as sampling at the carrier rate, with a sign change every half-cycle of the carrier). The carrier *frequency* is present in the output, but the carrier waveform is lost (the requirement for operation of such a mixer is that the carrier be of a certain min. amplitude, but the carrier amplitude variations are NOT well-preserved in the output.

Eh? You cannot keep diodes both "out of their non-linear region" and expect switching action from them; what you're trying to do is to make sure that the diode is driven ON far enough to avoid the distortion of the switching "knee", but I would hardly call that keeping the diode in a linear region!

> These mixers avoid the "close in" distortion problem you describe.

I'm not sure what you mean by "close in" distortion - if you're talking about output signal components at the sum and difference frequencies, you'd BETTER not avoid them; those are the sidebands!

5383. Need Macintosh Compatible ".Z" Decode

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-22 16:14:00 UTC
From: NIX@bigbrd.AUd.alcatel.COM
Message-ID: <9307221516.AA29623@aud.alcatel.com>
Source record: 278820

Can somebody please tell me where I can find a Macintosh compatible program that'll decode the ".Z" compressed "Info-Hams" Mail Archives?

For whatever reason, I never received Info-Hams V93 #874, and although I can get a copy of the file, from the Mail Archives @ UCSD.edu, I can't properly expand it.

Using a `decode' routine that I do have results in a file that "Word" can show, but the text is all run together, and there are what appear to be non-printable characters showing-up as "blocks" throughout the text, making it very hard to read.

I'm using Dartmouth's "Fetch" `ftp' utility to get the ".Z"'d copy of that particular archive, so I suppose there's always the chance that "Fetch" isn't properly transferring the compressed file.

5384. Out of Band Mod for Kenwood TM-431A

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-22 16:17:12 UTC
From: n4tii@kd4nc.uucp
Message-ID: <1993Jul22.161712.29497@kd4nc.uucp>
Source record: 278753

Hi gang,

I recently performed the out-o-band mod for the Kenwood TM-431a as published in ArtSci's Radio Tech Mods #4.

The mod is identical to the modification on the TM-231A : ie install a diode at point D209.

Well, after installing the diode at D209, the display wants to read 146.000 and it shouldn't. When installing the polarity of the diode the other way, the Tone-encode button functions the same as the "F" button.

Looking at the schematic, the non-usa version TM-431 has a diode in place at D211, which is not in place on the american version. Can someone verify if this is indeed the correct out-o-band mod?????

I am wanting to get the rig to receive into the 450 and 460 bands...(I am aware of the rules governing transmit.)

Has anyone performed such a modification on the TM-431 to get it into the 460's and if so, how did you do it?

Email me at : n4tii%kd4nc.uucp@gatech.edu

Or, you can just follow up here!

Thanks a lot.

John Reed, N4TII

Here is an on-line version (reformat it to your own needs):

------------ cut here ------------ cut here ------------ cut here ------------
From: wmb@ulysses.att.com (W M Brelsford)
Date: 3 Sep 91 20:47:20 GMT
Newsgroups: rec.radio.amateur.misc
Subject: DXCC Country List

The current ARRL DXCC country list follows. Changes from the
previous posting (11/90) include the addition of Penguin Islands
(ZS1) and North Korea (P5; effective with the first accredited
operation), and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s)
10. other amateur prefixes

Please mail corrections and suggestions to me.

Bill Brelsford, K2DI
AT&T, Basking Ridge NJ

Cross-posted to: rec.radio.amateur.swap,rec.radio.amateur.misc

If anyone has a used Icom UT-50 CTCSS Encoder / Decoder, UT-51 CTCSS Encoder or UT-49 DTMF Paging board that they no longer use or need, I would be interested in purchasing it. I use the CTCSS enough to want it, and the local ham shop is asking $75 Canadian for it. I suppose that this is a pretty fair price up here, but the radio itself only cost me $100! (IC-2SAT).

73, de
Scott

>temporary operating authority.

Hmmm. Here they (the ARRL) go again, blind-siding us with a policy position before having allowed sufficient (any?) time for open debate. Now in a preemptive strike they've deployed their legal SWAT team to file an opposition paper against allowing the issuance of temporary callsigns by the VE's.

Now darn it, I feel that if a person passes the test then they are entitled to the privlidges. When I got my first license I was no more qualified after waiting 10 weeks for the license than I was right after I took the test. The same applies for driver's licenses. Let's face it, you're more likely to kill somebody in a car than you are with an HT. I only learned of the proposed temporary callsign idea a couple of weeks ago (here on the net) and now, while still in gestation stage, the Board preemptively stomps their big ugly foot down on the proposal.

I don't think this issue has had enough exposure to the general ham population to warrant such a swift position by the league.

>
>The Board endorsed the concept of an international Amateur Radio
>permit, similar in nature to the international driver's license. It
>urged that the foundation be laid for the submission of a proposal
>to create such a permit to a future ITU conference.
>

And then, in amazement, I read the above! Yes, they'll fight temporary, VE-issued callsigns and yet are more than willing to pass the authority of issuing an international license to any state which can claim international soverignty. Need an international license, no problem! Just visit or perhaps just send $40 to some third world bureaucrat from Outer Slobovia and you're on your way. In other words, they don't trust our own VE's, but are perfectly willing to let unspecified offshore governments issue licenses.

Now I'm certain that there will be many which disagree with my opinions as stated above. Fine, I expect this. But it seems to me that the ARRL routinely makes influential decisions which affect hundreds of thousands of hams each year without asking us of our opinions.

Why doesn't the ARRL take opinion polls? The very idea that we elect representative members to voice our opinions in anachronistic at best. Has the ARRL ever held a general vote of the membership? Why can't the ARRL poll its membership? Why does it continue to hold on to the decidedly disrepresentative method of governing?

I'll be the first to admit that I don't know who my local section manager is. I didn't vote at all in the last local section election. I don't think that it's possible for anyone other than myself to represent my views when it comes to voting for change. There could not have possibly been a nominee who represented my views on all of the issues which might arise. Why then, should I compromise by voting for a candidate which possibly represented some of my views?

I would say that I'm not in the minority of members who do not vote under the current system. Given that the ARRL influences decisions which affect all hams, not just ARRL members, then one must conclude that as a group (hams) we are decidedly underrepresented. Let's assume (please prove me wrong) that 1 in 10 ARRL members vote in the section elections. Given that the ARRL represents about a third of all hams, then the voting population represents one thirtieth of all hams. And to top this off, this 1/30 group does not vote on issues at all. It votes for people who will decide the issues for them. If there were a general elections among all ARRL members, not only would the ordinary joe actually have a real vote on issues, but the actual representation in the process would increase by as much as an order of magnitude.

It couldnt' be that difficult for the ARRL to hold general elections. I get mail-in ballots cards once a year from several companies for which I'm a stock holder. Presumably, as a [member] I'm a 'stock holder' in the ARRL too. I get numerous mailings from the League

each year, how much could it cost them to do a mass ballot? I suspect that cost is not the issue, but rather the deisre by those currently in power not to dilute their considerable influence by the whims and will of the unwashed masses.

Something like that occurred to me after I posted my article, but I see a couple of (solvable) difficulties. First, transceivers usually recycle many stages between transmit and receive, so being able to generate a carrier while receiving (probably) means duplicating those stages (though perhaps in simpler forms). Second, you want to make sure the calibrating signal stays in calibration, otherwise its futile. I doubt that it's going to be easy to guarantee that one can generate an exactly 50uV signal at each of (say) 100 frequencies scattered (as appropriate) throughout 1.8 to 30MHz; but it's certainly not impossible.

It certainly would add some cost to the setup. Given the economics of commercial rigs, I think it would add a substantial cost; on the other hand, for a progressive homebrew setup, it might not be so bad (and could even be left out of one's rig if you knew someone else who had built the calibration circuitry, and could haul your rig over next to theirs every couple of months).

Hmm. Maybe there's a simpler way, though. If a 100KHz crystal calibrator could be built with an easily-guaranteed spectrum, then you could calculate the strength of the (say) 101st harmonic and go from there. But it seems unlikely to be able to build several hundred of these and be able to specify the strength of the 295th harmonic to (say) 5% for each and every unit.

Someone asked me to post this question for him. Please send your
replies directly to my email address.
There supposedly was a posting in this group about a company which
sells stuff very similar to what Radio Shack carries, but for lower
prices. Does anyone know the name, address and phone number of that
company ?
Thanks,
Amit Cohen <amit@lorelei.ece.drexel.edu>

You wouldn't believe. When I took the first code test the other testee
was allowed to bring his small child into the room and sit him at the table.
The child would sit quietly until the tape recorder was turned on, and then
he would start to fidget, squirm, grunt, sigh, and so on. I was sandbagging
that level a bit, so I was able to block out the distraction and pass, but
the father wasn't so lucky...

>stuff instead of getting rid of CB bandits on 10 meters.
>
>
Unfortunately Bill the FCC hasent got the balls to go after the CBers, or so-called "Freebanders"! Here in 6-land, the FCC has routine matters that take precidence, or so a growing number of hams are being told. In order these priorities seem to be:

1) AirForce 1 & 2, and all communications relating to or associated with government/military/diplomatic matters.

2) Commercial and Civilian Aviation, radar, atc, etc

3) Law Enforcement, Fire Protection and Public Safety Communications

4) Commercial Broadcast Communications and Common Carriers.

5) Business Communications, SMR's etc.

6) EMI/RFI Certifications/Type-Acceptance, Testing and Investigation

7) Licenses and related matters

8) Amateur Radio

9) CB Radio and all license-free Part 15 Matters.

So as you can see, it's of very little concern. Coupled with the class-action suits brought by MALDEF against the Commission in the early 1970's, for what was termed "Selective Proscecution"; The FCC is quite unwilling to do ANYTHING about the illegal use of frequencies, "in and around 10 and 11 meters..by individuals not in posession of a valid Amateur License or Aeronautical license having been grandfathered for said operations". That's right! Those freqs between CB and 10 meters are actually AERONAUTICAL MOBILE FREQUENCIES!!

As has been noted in several of my earlier postings, The ARRL has also turned an almost deaf ear to the goings-on, at least here in Los Angeles, Ca. I quite honestly suspect that the ARRL fears being the target of MALDEF should they attempt to have the FCC do it's rightful duty. I would personally like to see the INS and the Justice Dept. run MALDEF's core of Mexican Nationals, trained AS jailhouse lawyers out of the country and out of the FCC's hair!

(Why ask WHY? Run cw...give it a TRY! ;-)

>>>>>>>>>>> A Call for Articles <<<<<<<<<<<<

Summertime is the time when we usually experience a slump
in incoming articles. Naturally, practically everyone has found
something to do outdoors (be it recreational or not), so bench
work and writing drop a notch or two on the priority ladder.
This year is no different from the earlier ones.
We're in need of some good material for upcoming issues of
QST. Have you got anything on the workbench, in the computer or
coming together in your head that you can send our way? We'd be
happy to see it! We're especially interested in simple and
engaging projects that are relatively inexpensive ($200 or less).
If you'd like a copy of our Authors' Guide, please call, fax,
write, or e-mail the Technical Department Secretary (voice:
203-666-1541, ext 278; fax (24 hours) 203-665-7531; e-mail
bdicosim@arrl.org. Our address is:

Technical Department Secretary
American Radio Relay League
225 Main Street
Newington, CT 06111

Some folks don't know it, but we *do* pay for articles. You
may not get rich writing for us (although some of our authors
have done *quite* well selling kits and assembled and tested units),
but the extra money does come in handy!

Thanks for your consideration.

Sincerely,

Paul Pagel/N1FB

NOTE: This announcment was posted on Paul's behalf. If you have
questions or comments, send them to sford@arrl.org and I will relay.

From: hlivak@hale.ifa.hawaii.edu
Message-ID: <CAKwE9.4su@news.Hawaii.Edu>
Source record: 278818

I had previously sent out the following info:

KH6 on 160m. KH6DD and others will attempt to activate Hawaii on 160m
on July 23 starting at 0800Z (early Friday morning eastern time). The
group will have access to an AM broadcast tower scheduled for demolition.
Look for the group on 1831 kHz this one night only.

Due to one of the bigger lightning shows to illuminate Honolulu
in recent history, things have changed:

KH6DD on 160m Postponed. The fact that the broadcast tower beacon was
disabled by a lightning strike and other logistical considerations have
set back plans by one day. Now look for Hawaii on the Top Band on July 24
starting at 0800Z (early Saturday morning eastern time) on 1831 kHz.

It's not the best time of year and all that, but the tower is
only available now.

Regards, Bob Hlivak NH6XO

It seems that this problem is related to the way that Windows shares CPU cycles between applications that are running. Even if only one DOS application is running, and it has been set up in the PIF file for exclusive forground priority, the Windows itself takes CPU slices of time.

Windows is not a pre-emptive, prioritized, multi-tasker. It is only a simple multi-tasker sharing CPU time cycles. (This is one reason why it is not easy to use Windows in a real-time industrial control system).

SuperMorse depends on having continuous, uninterrupted, CPU timing cycles.

Anyone with more in-depth knowledge of Windows muti-tasking feel free to jump in here....

Bill

: Gilbert cell mixer?

This thread is starting to get a little arcane, but what the heck, there are those of us who enjoy arguing how many fairies can you get on the head of a pin. :=)

In a linear system, the output is always a scaled and offset version of the input: Vout = (A x Vin) + B. One property of linear systems is that no frequencies (other than 0 Hz DC) can appear at the output that were not present at the input.

In a perfect mixer, the output is the product of the two inputs: Vout = A x Vrf x Vlo (Vrf = rf input signal and Vlo = local oscillator signal). Clearly, in one sense, this is not a linear system. For example, if you feed the same signal into both inputs (Vlo = Vrf) the output is Vout = A x Vrf^2. If Vrf is a signal of frequency F you will get out frequencies of F and 2F. (Proof left as an exercise for the reader :=)

However it is more accurate to describe an ideal mixer as a linear, but TIME-VARYING, system. The equation Vout = (C x Vrf) holds AT ANY INSTANT OF TIME, because at any instant of time, Vlo can be considered a constant: C = A x Vlo.

For example, a diode double-balanced mixer can be viewed as a switch, where the polarity of the rf signal is switched at a rate determined by the lo signal. You could implement a very LINEAR, low-distortion but low-frequency mixer by using fast, bounceless relays as the switch elements instead of diodes. The relays are either on (0 ohms) or off (infinity ohms) and have no non-linear region. A truly linear mixer!

A diode mixer tries to emulate this condition by switching the diodes on and off as hard as possible. That's why high drive levels are important for low distortion.

ben@nj8j.atl.ga.us (Ben Coleman) writes:

>As an Extra-class operator, do I operate under the Canadian segmentation(or
>the lack of it), or am I still constrained by the American band segments?

You are constrained by both laws. ie, you can not operate outside any
Canadian band (ie, Canadians do not have anything above 450MHz on the
70cm band) AND you must observe all your US band and mode requirements
(you can not use phone on 14.14MHz) for your class of license.

>How do the other license classes translate to operation in Canada?

They don't, that is the point.

: I initially discounted his sarcasm, but, live and learn!

[Rantings and ravings about the ARRL VEC being too slow in processing
license applications deleted.]

One problem an organization like the ARRL has, is that the more it
tries to do for its members (and non-members), the greater the chance
of pissing someone off. Someone should point out that the ARRL does
not make a dime on the VEC. This service, offered equally to members
and non-members alike, is subsidized by the ARRL membership.

I think the ARRL is crazy to agree to take over licensing of club
stations, as the FCC has proposed. They will get little or no
thanks from those who use the service and will have to suffer the
slings and arrows of outragous indignation from anyone who feels
their service was not up to snuff.

I've seen a couple of messages relating to, "Who needs Amateur Radio for public service communications, when the police, fire, emergency management and other agencies now have reliable, high-tech equipment and good operators?"

Here's my comment du jour:

The above is almost true, except that most towns, cities, counties and states don't have the money or resources to conduct exercises--and even real emergency operations--with dozens (or hundreds) of trained operators, who mostly get paid...and overtime on weekends, evenings and holidays!

If you were an official responsible for some public service agency, how would you feel if approached by a recognized nonprofit community group that offered a large number of trained, competent communications specialists, each equipped with his/her own radio gear, and all willing to participate for FREE at almost any time, 24 hours, 365 days a week? And they could operate voice, code, packet, RTTY, ATV and more on bands from 1.8 to above 1200 GHz?

I believe that if this is the main thrust of a proposal to offer Amateur Radio services to a local/state government official, he or she would be foolish to turn it down. And even more so when you, as a tax-paying member of that community, went before the next government meeting to state that you were very disappointed that Official X turned down such an offer!

Just some thoughts...

5422. S Meters and Modern Technology (was Re: TS50)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-22 21:54:38 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9307222154.AA16354@netmail.microsoft.com>
Source record: 278645

One simple way of calibrating rigs would be to use a marker generator that generates a very fast pulse (a few nS from a 74F00 or a schottky diode) at say 1Mhz rep-rate (just the old crystal calibrator with a fast switch). By using a very short pulse you will get almost equal contributions in all the harmonics (remeber your Fourier transform theory?) so there are no problems calibrating the frequency response of the reference oscillator. Then add a switchable attenuator (wouldn't need many levels perhaps even a PIN diode attenuator controlled by a DAC) and some software. Just a SMOP :-)

Given that all modern rigs already have a bunch of xtal osciallators in the box (or just one on the fancy rigs!) this seems to be a minimum amount of extra components to acomplish an accurate self calibration.

Question to the person who said that the IARU region one has a standard 5.6dB S unit. Why 5.6dB? Why not just define S9 as 50uV in 50 ohms (-73dBm) and left S1 be 48dB less (there are 8 6dB steps from s9 to s1) at -121dBm. This is also strange given the noise floorin most RXs these days is < -135dBm (under the band noise). The thermal noise floor is only -148dBm in 500Hz at 298K.

I think I agree with Zack Lau -- the signal strength meter should give an indication in dBm at the antenna socket and not some artifically referenced level.

For that 6 levels should be enough:

0 -- inaudible (!)
1 -- barely audible (just above the MDS)
2 -- weak signal
3 -- moderate signal
4 -- strong signal
5 -- very strong signal

Bears a funny resemblence to the readbility scale ....

There is also a good psycological basis for this. See the "Magic number 7 plus or minus 2" paper on the fineness of discrimination a human can make. Normally about 3 bits worth.

I won't go into the tone scale -- but I guess we have to keep T1 thru T6 just in case spark transmitters or rectifiers go out of style :-)

Scuse me? Then why don't they just "correctly" assume that hams will not stay within the prescribed limits associated with their licenses and just not issue them in the first place?

I doubt if very many die-hard radio bootleggers take the trouble to earn a ham license.

TO ALL RADIO AMATEURS

SB PROP ARL ARLP027
ARLP027 PROPAGATION DE KT7H

BOTH GEOMAGNETIC DISTURBANCES AND SOLAR FLUX DECLINED LAST WEEK. SOLAR FLUX HAS DIPPED BELOW 100 AGAIN, AND WILL CONTINUE TO FALL TO AROUND 80 AFTER MID MONTH. FLUX SHOULD THEN RISE AGAIN, BUT PROBABLY WON'T PASS ABOVE 100 UNTIL AUGUST.

THE AVERAGE SOLAR FLUX FOR MAY WAS 118.7, AND JUNE WAS 109.4. THIS TRACKS CLOSELY WITH A PROJECTION FOR THE REST OF THIS SOLAR CYCLE RELEASED LAST MONTH, BASED ON PREVIOUS SOLAR CYCLES. IT SHOWS SOLAR ACTIVITY RISING GRADUALLY AFTER AUGUST, REACHING A SHORT TERM TEMPORARY PEAK AROUND 127 IN APRIL, 1994. THE PROJECTED SOLAR FLUX DOES NOT FALL TO THE CURRENT LEVEL UNTIL JANUARY, 1995. THEN IT CONTINUES DOWN TO A SOLAR MINIMUM AROUND THE START OF 1997, WITH SOLAR FLUX OF 72. THE NEXT CYCLE RISES QUICKLY, REACHING THE CURRENT LEVEL AROUND THIS TIME IN 1998, AND THEN REACHES THE NEXT PEAK IN AUGUST, 2000.

SUNSPOT NUMBERS FROM JULY 1 THROUGH 7 WERE 102, 73, 95, 104, 99, 80 AND 63, WITH A MEAN OF 88. 10.7 CM FLUX WAS 108.1, 109.9, 110.5, 106.5, 100.5, 95.2 AND 93.4, WITH A MEAN OF 103.4._

THE PATH PROJECTION FOR THIS WEEK IS FROM THE CENTER OF THE CONTINENTAL UNITED STATES TO HAWAII.

80 METERS SHOULD BE OPE_ FROM 0430 TO 1300Z, WITH THE BEST PROPAGATION FROM 0730 TO 1030Z. 40 METERS SHOULD BE OPEN FROM 0300 TO 1430Z, PEAKING FROM 0530 TO 1130Z. 30 METERS SHOULD BE OPEN FROM 0100 TO 1630Z, WITH THE BEST TIME FROM 0430 TO 1230Z. 20 METERS SHOULD BE OPEN 24 HOURS PER DAY OVER THIS PATH, PEAKING FROM 0430 TO 0900Z, AND THE WORST TIME FROM 1930 TO 2230Z. 17 METERS SHOULD BE OPEN FROM 1530 TO 0700Z, WITH THE BEST PERIOD FROM 0100 TO 0600Z.

10, 12 AND 15 METERS DO NOT LOOK GOOD AT THIS TIME FOR THIS PATH._

SB QST ARL ARLB072
ARLB072 902 MHZ STUDY SOUGHT

902 MHZ STUDY SOUGHT

''ADOPT NO RULES WITHOUT FURTHER STUDY,'' THE ARRL HAS RECOMMENDED TO THE FCC, IN A COMMISSION PROPOSAL TO EXPAND THE USE OF AUTOMATIC VEHICLE MONITORING (AVM) SYSTEMS IN THE 902-928 MHZ BAND.

THE PROPOSAL, IN PR DOCKET 93-61, WOULD ALLOW THE EXPANSION OF AVM SYSTEMS THROUGH THE CREATION OF A NEW LOCATION AND MONITORING SERVICE (LMS) IN THE 902-928 MHZ BAND. AMATEURS ALREADY SHARE THIS BAND WITH GOVERNMENT RADIOLOCATION, FIXED, AND MOBILE SERVICES, IN ADDITION TO INDUSTRIAL, SCIENTIFIC, AND MEDICAL (ISM) EQUIPMENT AND VARIOUS NON-LICENSED, LOW-POWER ''PART 15'' DEVICES.

THE FCC SAID IN ITS NOTICE OF PROPOSED RULE MAKING THAT SUCH AN EXPANSION OF AVM IN THIS FREQUENCY RANGE ''COULD LEAD TO RAPID CONGESTION OF AVAILABLE SPECTRUM'' AND ASKED CURRENT USERS OF THE BAND IF THEY COULD HANDLE ANY INCREASED CONGESTION.

''IF NOT,'' THE FCC SAID, ''COMMENTERS SHOULD OFFER POTENTIAL SOLUTIONS, SHORT OF REMOVING PART 15 USERS AND AMATEUR OPERATIONS FROM THE BAND, RESTRICTING WHERE SUCH USERS COULD OPERATE IN THE BAND, OR PLACING STRICTER LIMITATIONS ON THE OPERATIONS IN THIS BAND.''

THE LEAGUE SAID THAT NO ACTION SHOULD BE TAKEN UNTIL THE FCC HAS STUDIED THE POTENTIAL FOR INTERACTION BETWEEN AVM AND WIND PROFILER RADAR SYSTEMS, THE SUITABLIITY OF AVM OPERATIONS FOR HIGHWAY SAFETY SYTEMS IN A CROWDED RF ENVIRONMENT, AND THE ALTERNATIVE TECHNOLOGIES AVAILABLE FOR THE SAME PURPOSE SERVED BY AVM AND LOCATION AND MONITORING SERVICES.

MORE INFORMATION IS IN QST FOR MAY 1993, PAGE 88.

>program that'll decode the ".Z" compressed "Info-Hams" Mail Archives?

Paul,

The program you are looking for is "Maccompress". It *should* be available
from wuarchive.wustl.edu. Maybe you've already tried this, but if you have
access to a UNIX system, you could try the "uncompress" command on the file.
Also, I usually transfer .Z'd files as binaries, instead of text.

I hope this helps.

(For the curious, my call is N0NRO.)

Source record: 278761

So, after following this thread for the past day or so, I have
several questions:

1. Is there, or is there not, a requirement that a given radio
be "type-accepted" for use outside the amateur bands, regardless
of license held? I heard some speculation that this applied to
freq's less that 140MHz.

2. What exactly is "type-acceptance" and if there are such regulations,
what purpose do they serve? For me as a licensed amateur as well as
a member of a group licensed to use three frequencies in the 151 range,
to have to buy two separate radios to transmit on seems pretty ridiculous.

Re the latter, are you referring to the customer who wants to avoid
purchasing a book that Radio Shack went to some expense to provide for
sale to their customers and who demands that Radio Shack assist him in
using the information contained therein at no charge?
I'm no big proponent of RS, but for someone to expect free use of RS
products AND free customer service time at the expense of other customers
for a $2 or less purchase seems a bit extreme to me. But then, some
people are more equal than others...

>soldering iron, however, will be an exercise in frustration. Once you've
>learned how to do surface mount rework, you'll hate to have to deal with
>through hole boards.

I wholeheartedly disagree. First, when I was working for a startup
company, the cheapest hot-air source we could find for the purpose was
$900. Second, although I've been soldering since 1963 with two cold
solders that I know about to date, I couldn't find a way to get all the
pins soldered, period, including touchup with a needlepoint soldering iron.
Third, multilevel boards are not all that hard to deal with; it took me
fully three days (in the 1970's) to become expert at removing, cleaning
and replacing parts on ML boards without ruining vias, lifting traces,
bridging solder points, or any of those hazards, and the solder sucker
(my particular religion; I _hate_ braid!) cost all of $15.
I will agree that UNsoldering SMT parts is easy with the air gun,
though; but cleaning the pads for new solder paste is a pain, unlike
cleaning multilevel board holes.
Disclaimer: maybe there's something I don't know because the people
who supplied the air gun and training didn't know it either.

As a TV serviceman years ago, this came in handy for me with customers
with a sense of humor. I'd misadjust the horizontal hold from the back
on a formerly watchable set before plugging it in, then turn it on and say
"Now, isn't that better?" The reactions I got were hilarious, but when I'd
adjust it by ear to lock the picture without looking, a lot of jaws hit the
carpet!
Once I fixed mmy brother's old TV, which had individual plug-in wires
connecting to the deflection yoke. I deliberately reversed the vertical
deflection wires, which of course made the picture upside-down, and when
he complained, I leaned over the set from the back (thus looking at the
picture upside-down) and said "I don't see anything wrong with it...!"

Kevin, KN6FQ writes:

In article <10772@tekig7.PEN.TEK.COM> royle@tekig6.PEN.TEK.COM (Roy W Lewallen) writes:
>>doesn't sell rigs, so it isn't done. (I'm told but haven't verified that the
>>old Collins rigs had not only a consistently sized S-unit, but a calibrated
>>signal strength for S9. Neither of these is so for modern rigs.)

>My Hammarlund SP-600 has an S-meter calibrated in uV and dB, although I
>haven't looked at a schematic or tested it for accuracy.

I think the scale is called the dbuV, with the reference (0 db) at 1uV.
On "our" S-scale, 1uV is a solid S3 (or about -108dbm). Wonder why amateur
gear didn't just stay with this arrangement? It makes too much sense in
all likelihood! Or maybe it was too technical and not arbitrary enough,
or difficult to do, or what? Look at how it works! 0db is 1uV, +20db is 10uV,
+40db is 100uV, and so on....Seems to me that there is a reasonable answer in
that there just isn't enough "reports" to describe it perhaps. I mean, with
the 'S' system we squeeze S1-6 between 0 and +20dbuv. But then again there
are more (0-20) on the other! Who knows? Instead of sending 569 on CW you'd
need to say 5219, Hi! Maybe thats it!? RST 579 would be a bad report (S4)!

Wonder how accurate they were?

Yes, you're right! And that point made me remember that their were several
radios of that vintage that also indicated signal strength in dbuV values.
I used to work on a few models that had that feature when I was in the Navy,
and I plum forgot! The R-390 series was one, and before it, it's kin the
R-388 and 389. There were others as I recall as well. We didn't calibrate
the meters on maintenance however, as the application was a special signals
intercept mission, and the radios were fitted with wide-band IF's (125khz)!

That brings a question to mind for me. In fact, I wanted to ask this in
a different note, and forgot or couldn't make it fit in, so I left it out.

Does anyone know when/how the concept of the S-meter really got started?

There are several reasons for the question, such as:

1) Since the entire S-meter scale itself is not "anchored" in any
real absolute value, I wonder how/why they placed it as they
did when referenced to the dbm values? What I mean is, why did
they (wonder who they were?) place the scale such that S9 is
-73dbm? I mean, why not S9 at 45uv, or 35 or 63uv, or -72dbm?

2) Or was the low end S0 and S1 placed where it was relative to the
typical receivers of the day, and it just happened that that
resulted in S9 becoming 50uv when the scale was referenced to

the dbm scale?

3) Was it started by an amateur proposal, or perhaps a manufacturer?

4) Or why not the dbuV scale as presented above by Kevin? It certainly could never have suffered from the plight of the S-meter scale and its sort of dubious nature and reputation. It was widely used and the reference absolutely specified, for all to see. No room for arbitrary interpretation here; 0db IS 1uV! Nice and clean and clearcut. I like that!

The S-scale was kind of "spliced" to the others in a sort of arbitrary way, by whoever, and its dubious nature has become its accepted fate thru haphazard application over the years. So much so, that most of our fraternity don't or won't accept the specification, and still believe "there is no standard for S-units", which is what started this thread to begin with.

You wanna' know why there's so much confusion and lack of acceptance of this idea of a standard. Witness this from note 877:

>>>>> Contrary to popular belief, there is no standard for S-unit size. <<<<<

WJ1Z, David Newkirk, Senior Asst Tech Editor, American Radio Relay League added from 879:

"I agree with this statement in the sense that there is no *one, agreed-upon and liberally applied standard.* To *me*, that's the same as saying "there is no standard,"

OK, but do you think it could be made to be more "liberally applied"? Is there any chance of that, I wonder? Maybe if it was prominently displayed in "our" journal on occasion the people that build the hardware might just get on the bandwagon and get it right instead of perpetuating the myth.

Then David added this, also from 879:

"For the record, however, IARU Region 1 adopted the 6-dB-per-S-unit, S9=50-microvolts standard sometime ago. So, ham-politically speaking, there *is* an S-meter standard, as non-operative as it may be."

I'm assuming that this concept (the S-scale) was originated by radio amateurs, because I don't know of any commercial or military radio discipline that uses the 'S' scale as a reporting system. That doesn't mean they don't, I just don't know of any.

I do know that there was apparently a time when receivers did not have such a scale, but as Kevin said above, they indicated uV, db or some arbitrary value that was truly irrelevant. The advent of the S-scale just seems to have added another.

Well I've no doubt there are antennas out there that will out perform the Larsen ducky. But the issue is not just performance but convenience. How often will you want to be switching antennas back and forth or walking around with the whip on and fully extended?

>Bart J. Jahnke, KB9NM
>Manager
>ARRL/VEC

Both the VECs and the FCC makes poor to no use of computing facilities.

1) In all cases computers could be used by the VE to enter the test result information in the format required by the VEC

2) Diskettees and paperwork (which really should be negotiated for elimination with the FCC for total electronic document interface (EDI))) could be sent to the VEC. VEC could then ingest into its on-line system

3) The VE should be responsible (and really are de facto if not de iure) for the validation and verification of format and content. As a result minimum checking should really be done by the VEC. If everyone has to do everything again then somehow the system has processing flaws.

4) The validation of the VEs should be handled by a number assigned to the VE as part of their certification by the VECs.

This process at all levels is still !!!! TOO !!!! manual. It appears as if the belief is that a manual process is the only way to ensure accuracy and validity. Just because we haven't automated the WHOLE process before doesn't mean we can't start doing it now. Very few of the type of people performing VE service don't have access to a computer. Paper should be involved only because of the FCC and we should really lobby to automate their part so we can use EDI when dealing with them.

Generally, I think that Brian has made some good arguments. However, I question whether must hams are really trained properly for handling emergencies either at the tactical level or even H & W. To ensure that things work properly at the time of an emergency scenario driven training incorporating the elements of the "total emergency network" has to be done. Only a small number of hams actually take part in this type training. Many of the hams and official emergency agencies don't even properly communicate and coordinate.

Even the ham portion of the emergency network is not properly exercised in many places. Some hams tell me that field day is the vehicle for such training. However, I have to say that field day has been become nothing by a QSO contest. Establishing training for emergency communications based on field day experiences is not even remotely feasible. About the only thing is shows is the time it takes to find all the equipment (radios, cables, antennas, generators, etc) to even begin the process of setup. For many clubs, it takes most of the year to plan for the field day.

More hams really should become part of the official ham emergency groups. More hams involved with these groups would mean a larger pool of really trained people.

This statement above is absolutely correct. In fact, the last time I was down at ARRL, they mentioned (in the VEC office) that the fees from the testing sessions don't even cover the expenses to copy all the forms and tests (BLANK FORMS) and to process everything (FILLED IN FORMS). That means the moneys for this are coming out of the membership's back pocket and the goodwill of the volunteers.

I suspect the story is the same with W5YI and all other VECs.

THANK YOU, ARRL AND W5YI AND ALL THE REST, FOR THE SERVICES YOU PROVIDE.

It would be nice to hear more positive items on this net instead of the constant code-nocode battles, or the incessant ARRL criticisms and blamings. I know, that WOULD be asking too much.

I know which way I vote. I *hate* it when I've driven all the way
to a store for a specific item and then am kept waiting for the
counter help to deal with phone calls. It's usually not too bad
at RS, but HRO is the pits. Here I am standing with money in my
hand, and I can't get service because the clerk is answering the
constantly ringing phone. If they do that much phone business,
then they should hire full time phone staff and not annoy the
paying customers waiting to be served.

>
>

If you don't want to build.. the MFJs are real nice. If you go with
30 or 40 you will need to buy the audio filter, or make one of your own..
a necessisity on those bands. I have done some heavy testing on using
QRP rigs and my favorite band is 20 then 40 then 30.

I find 20 open the most then 40 then 30.. lots of noise and not as
many people on 30. MOre rag chewing on 30.. I use the lower
portion of 20 for DX.. and up around 14.050 for rag chewing..
I operate a Ten TEc 509 mobile/CQ/QRP in my car and have
no trouble making contacts on 20.

Yeah, with components on both sides of the board, speed is of the
essence. It's usually best to use a hotter air source and work
very quickly to prevent the heat having time to migrate through
the board and having parts drop off the other side. You never
see where they came from. I hate that. :-)

The Pyropen is great for this because it's infinitely throttlable
from about 30 watts (Jr.) to practically nothing. At the high
setting, most parts come off in under a second, without damage.
If the part is a 64 pad monster, the old reliable Bernz-O-Matic
torch can do a good job. But you *really* have to be practiced
with this or instant charred board. The first time my GM saw
me attacking a $30,000 ENG camera with the torch he about freaked.
Practice on scrap first, I'm glad I did.

Let's see the proof. :-)
In my day, we called such a circuit a *phase detector* and the only
outputs for identical signals on both ports is a DC voltage proportional
to any phase shift between the input signals, zero if they are in
phase, and a larger copy of the input signal frequency as the two
waveforms add constructively. If there is phase shift, you get DC
plus a complex shaped waveform.

5454. Re: TS50 Illegal!

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-23 14:52:27 UTC
From: ron@topaz.bds.com
Message-ID: <22otvbINNju2@topaz.bds.com>
Source record: 278578

Is there, or is there not, a requirement that a given radio
be "type-accepted" for use outside the amateur bands, regardless
of license held?

Yes. A radio must be type accepted for use in nearly every service
other than amateur.

What exactly is "type-acceptance" and if there are such regulations,
what purpose do they serve? For me as a licensed amateur as well as
a member of a group licensed to use three frequencies in the 151 range,
to have to buy two separate radios to transmit on seems pretty ridiculous.

The average user of a non-amateur radio (commercial, aviation, whatever)
isn't expected to know anything about radio (you can argue that this is
rapidly becoming true of hams, too, but lets ignore that for a moment).
He isn't allowed to do much with his radio other than turn it on and play
with the volume and squelch. He's not allowed to set the frequency (other
than selecting from a few already programmerd in). An authorized technician,
someone trained in the rules and such is supposed to make all adjustments
(formerly this just meant you passed the Commericial Radiotelephone test).

Now amateur radio is an experimental service. Hams are supposedly trained
and able to make sure their rigs are within the technical specifications for
use on their own frequencies. However, the FCC doesn't trust hams to be
able to do anything outside the frequencies they've been allocated, so they
won't trust you to play around in the business band, even if you have been
licensed to operate there.

You don't have to purchase radios. There are a number of type accepted
radios that can operate in both bands. They're not as snazzy and full of
bells and whistles as the made-for-hams counterparts, but they will transmit
and receieve, do PL, and send touch tones just like a ham rig. Back in the
pre-synthesizer days, people looked down on you around here if you used made
for ham stuff, everybody converted commercial rigs for amateur use. Many
repeaters are still gear that's also type accepted for commercial use.

-Ron

5455. 4U1WB - What Country Is It???

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-23 15:09:44 UTC
From: ed@imp.pnl.GOV
Message-ID: <9307231509.AA10100@imp.pnl.gov.pnl.gov>
Source record: 278662

I recently got a card back from a contact with 4U1WB, the World Bank headquartered in Washington, DC. My question is: for DXCC purposes does this count the same as a qso with the UN? The ARRL DXCC Countries list shows two different 'countries' for the 4U1 prefix: UN Hdqrtrs in NA and ITU Hdqrtrs in EU. The reason I'm confused is that most callsigns are associated with a specific country and the 4U1 prefix isn't. Any experts out there that can help on this one? I realize I can just send it in with the next batch of cards to the DXCC desk and find out, but I just got curious...

> Disclaimer: maybe there's something I don't know because the people
>who supplied the air gun and training didn't know it either.

Indeed!

A Pyropen is $39.95 *retail*, and fits in your shirt pocket. It's
trivial to get good SMD joints with it, and SMD parts self align
by surface tension when heated. Naturally there are tricks you have
to master to control the temperature correctly, and good SMD solder
paste is a must. Use of modelling clay dams is a big help in getting
the heat exactly where you want it. Cleaning the pads is easy too,
but you have to use that evil Solderwick. Solderwick isn't really bad
if you keep a bottle of liquid rosin handy to keep it saturated. Then
it really wicks. Remember there are no holes to trap solder on a
surface mount board. You want to leave a light "tin" on the pads
anyway.

Thru hole boards, on the other hand, have gotten cheesier as time
has passed. The professional broadcast still stores and frame syncs
I work on have 8 layer boards that will delaminate if you look at
them wrong, much less bring a soldering iron near them. The traces
are very thin, and the vias are porous. If you use a solder sucker,
you'll come away with a via. :-(Then you have the joy to tacking

in pieces of wirewrap wire to re-establish connections. I've never had a laminate lift on a surface mount board.

And surface mount boards are much easier to troubleshoot. There are no hidden connections. All you need is a sharp probe to test any point in the circuit. I know the standard religion is to never reuse a SMD after you've removed it from a board, but I've found you almost never trash a SMD by removing it from the board for a test, and using silver bearing solder paste eliminates the leaching problem. On the other hand, removing a DIP from a thru hole board almost always trashes it. I find I can troubleshoot and repair a surface mounted circuit faster than I can a thru hole board.

September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
```

arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

: Marc DePaul

Well, at the time it happened, (1958) it was done to a friend of mine, who
was down the street from where I lived.
His father was a Ham (W1DXV) who I once heard on my cats whisker
radio (woow! WHO was THAT!).
That began my intrest in Ham radio, and towards the attempt, we strung a
telegraph line between us and used that for code practice.
Being summer, he would sleep on his front porch...I mean TRY to sleep on
his front porch. The 280km band was OPEN each nite, all nite, and he'd be
up late each morning (good thing school was out).
He got his ticket,...Kn1PRH, and I *think* he now owns an insecticide
company.
We moved shortly after and Ham radioing ideas went on the back burner.
In 1988, my brother,and a fiend of his, got their tickets, and I followed
up the rear.
However, we were prepared for the 280km band....I warned them.
I was NOT prepared for what I heard, as a source of CW...
On some nights, not all,I'd hear a breif bit of CW, which was un-locatable.
I'd catch 1 or 2 letters.... D....F then A then U.
I had set up a derilect camper, as a radio shack (NO! not the Tandy kind)
and had taken to sleeping out in it to SWL myself to sleep....I mean TRY to.
Only once in a while it occured....G ......A......(silence)
It sounded like it was coming from the radio and I'd get up to reset the dial
to another freq, figuring I'd dodge this problem.
Oh yeah? Next nite...WITH THE RADIO OFF.... E.... A (silence)
What is this? Did I leave some other radio on some where?
I had a collection of sets and there were times I'd leave them all on to
supply warmth...as it was October, and a bit chilly at nite.
Knowing that if you disconnect the speaker and use a 10 ohm resistor in
it's place, you'd not hurt the output transformer, I did that.
Next nite: D... G.....
Ah HA! it's the audio transformer ITSELF! One of these radios has loose
laminations in it's transformer!
So, I took to un-plugging all the 6AQ5 tubes (audio output's) and 6V6's
(older audio out put tubes)each night.
I wanted to find the source of this real BAD!

Next nite: ...(silence)
Ah! that must have been it! Life goes back to normal. Oh yeah?
Next nite: ....D ....G
This can't be! All the tubes are rolling around on the table
There's NO WAY these radio's can be doing this!
The crickets can't be doing it,cause its too cold and besides, they
rag-chew when they do CW... not this 007 spy stuff!
After 3-4 weeks I finally found the source.
Only when the wind blew v e r y gently, and just that amount,the end of
A tree branch was scraping the side of the camper, just right , to make a
reasonably 'pure' deeet sound.

Mother nature is a LID !

--

Randy,KA1UNW If you get a shock while servicing your equipment
DON'T JUMP! You might break an expensive tube.

5463. Re: 6 MTR OPENING TO SPAIN/EAST COAST USA

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-23 17:14:59 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <CAMnwz.Jyv@odin.corp.sgi.com>
Source record: 278772

July 23, 1993 Friday

this morning at 0600CDT (1100UCT or Z) i awoke and before getting
up turned on the tv. just wanted to see if news was on before getting
up. i'm in the country, thus no cable. there were some awesome signals
on channel 2 through 34. i figure about 400 miles or better for
longest skip. channel 8 in dallas (i'm 35 miles away) was completely
buried by another station. i didn't take notes. i don't have
anything that'll get above 10 meters in the shack.

oh! definition: awesome signals - rf energy great enough on assigned
channel to receive crisp clean image and audio if
station is not being interfered with. on channels
2-12 i was getting more than one signal from separate
sources.

i don't know how long this lasted, as i turned off the tv after 5 minutes.

gotta get me a 6 and 2 meter weak signal cw rig. ;-)

Surely the DC volts are at a *maximum* for zero phase shift (output
proportional to cosine of the phase angle), and the bit on top is
at twice the input freq (f1 +/- f2, where f1=f2)

Not sure why it shut down in WWI, but most likely because everyone was
basically on the same wavelength.

: Why was Amateur Radio shut down in WWI? Fear of Espionage? Why was it
: not shut down in other wars?

say what? Amateur Radio was off the air before the sun set on Dec 7, 1941.
remained off untill a couple months after the 'big' one. WWII was the last
'war' that the US fought, the others were police actions.

They (the volunteers) shouldn't have to pay for anything.

Well, stop taking it out of "the back pockets" of ARRL members. As quite a few of us have seen, the ARRL is now connected to the Internet. Drop the DIRECT connection, and save several thousand dollars a month.

That's meant more of a poke in the side than anything. But it cues a question, Why is the ARRL online? Why not just hookup to a mail/usenet server. Is there a possible expansion in mind?

5473. Type Acceptance (was TS50 Illegal)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-23 20:18:43 UTC
From: erik@peewee.chinalake.navy.mil
Message-ID: <CAMwF7.KEC@avalon.chinalake.navy.mil>
Source record: 278634

Here is what I understand to be true and how I feel. Please feel
free to correct me wherever necessary.

Amateurs do not need type acceptance for anything transmitted inside
the amateur bands since we are personally responsible for the purity
of the transmitted signal. We have to demonstrate some knowledge of
the principles of radio transmission before we can be licensed to
transmit.

Bands which do not have such rigorous licensing (and personal signal
purity responsibility) use type acceptance to assure clean signals.

Since we have already proven we know what we are doing, AND have
accepted responsibily for our signal quality, I see no reason why
amateurs should be prohibited from using non-type accepted equipment
in non-amateur bands for which we also have a license to use.

In other words, as long we are responsible for our signal, and the
signal is proper, what difference does the model of the equipment
make?!!!!!!!

I say that type acceptance is used primarily to control and limit
traffic to *specific* frequencies and power levels. We do this
as a matter of honor already.

A good example is GMRS. I would sure like to use my handy dandy dual
band amateur HT. But nooooo, the FCC says GMRS rigs can ONLY be "type
accepted" and ONLY crystal controlled (high-tech?) rigs can be type
accepted. If the FCC trusts us to use legal power, frequencies,
antennae, etc. In the amateur bands, WHY NOT TRUST US ELSEWHERE THAT
WE ARE ALSO LICENSED?

I suppose it would be quite difficult for anyone to actually determine
that my rig is not crystal controlled by monitoring my transmissions.
However with an $8000 fine at stake I certainly am not interested in
finding out.

In the U.S., ham radio was also shut down during World War II
(although I think the old 112-MHz band was kept open for use by hams
in some sort of civil-defense type organization).

To all radio amateurs

SB DX ARL ARLD040
ARLD040 DX news

Thanks to Tedd, KB8NW the Ohio/Penn PacketCluster Network; Chod, VP2ML and the DX Bulletin, for the items in this week's bulletin.

ANGOLA. Kim, OZ1ACB, is now signing D2EYE. He should remain active until some time in December. Check 14020, 21020 and 28020 kHz for CW and 14195 kHz for SSB. Due to equipment problems, when operating split he can only listen exactly 5 kHz up.

ALAND ISLANDS. Martin, aka Mart, DK7ZB, plans to be active as OH0/DK7ZB from July 25 through August 20. This is slated to be a CW only event on 160 through 6 meters, with an emphasis on the WARC bands. Equipment particulars include a 3 element tribander yagi for 15, 12 and 10 meters 2 element yagi on 20 and 17 meters Delta Loop on 40 and 30 meters and Double Zepp on 160 and 80 meters. QSL via the bureau only.

TRINDADE ISLAND. Rolf, PY1RO, plans a 5 day operation starting around July 28. He will operate on 160 through 6 meters, including 17 and 12 meters, mainly with CW. For IOTA chasers, he may get to Martim Vaz Island for a short period. If this occurs it will be the first time for Martim Vaz to be on the air. Please note that Martim Vaz counts for Trindade for DXCC purposes. QSL via Rolf Rasp, PO Box 51, Rio de Janeiro, RJ, 20000-970, Brazil.

ANGUILLA. John, KA3DBN, will be active as VP2EBN from August 22 through 30, with activity on 80 through 6 meter CW, SSB and RTTY. WARC band CW will receive special attention. John may also get on from Saint Martin towards the end of his stay.

HONG KONG. Martti Laine, OH2BH, will be moving soon to Hong Kong for a 2 year long, work-related stay. Expect a serious signal out of VR2 and perhaps occasional visits to BV, BY, DU, HL AND P5.

MARION ISLAND. Christie, ZS8MI, can be worked longpath on 14195 kHz between 1000 and 1400z. He has also been caught on 14247 and 21205 kHz, and is expected to be doing some CW as early as August.

THIS WEEKEND ON THE RADIO. The Venezuelan Independence Day Contest CW weekend, sponsored by the Radio Club Venezolano, runs from 0000z July 24 through 2400z July 25. For more information, check page 117 of June QST.

THE RSGB IOTA PHONE CONTEST, a 24 hour event, starts at 1200z on July 24.
NNNN

Good Luck on DX de KB8NW

During World War I the Department of Commerce banned all non-military transmitting AND RECEIVING. At that time radio was a relatively new technology and I am sure was banned for many reasons.

Just a short plug for the League. If it had not been for HPM and the ARRL it is doubtful that amateur radio would have existed in the post-WWI radio world. After the war and partly because of it, radio moved out of the experimental realm and hams became a pain to commercial and later broadcast stations.

73, Harold, N4FLZ

P.S. While talking history, it is interesting to note that no one really ever considered the emergency/public service uses of amateur radio until after a great flood in the Ohio Valley during 1935 or 1936. To hear some talk of it now you would think that was why we where founded - in fact that did not become a part of our mission until almost 25 years after the fact!

I think it was for that reason in WW I. It was also shut down during WW II, probably for the same reason. It also might have had something to do with shortages of radio gear. The military called for (and got) lots of gear and parts from hams to help with the war effort. There was a couple of interesting articles in QST in Dec. 91 issue (50th anniversary of Pearl Harbor) about hams and WW II.

Tom Bodoh (bodoh@dgg.cr.usgs.gov) wrote:

: ARRL - what's the real scoop? Please answer here rather than email - it
: seems that inquiring minds want to know...

I got a response by e-mail, but don't consider it appropriate to post it
publicly. I hope that they will defend themselves publicly.

One area I would like detailed is EXACTLY what they must do to each
application before forwarding it to the FCC.

The 610 and all the tests are filled out when they get them, as far as I can
tell. There must be something that is not obvious that they do.

What is it, And why can W5YI complete the same function so much more
efficiently?

I find it interesting that ALL responses to my original post, e-mail and
personal, (excepting those from ARRL), have been statements supporting
my view.

The Anally Retentive Regulation Lovers, (pardon my sense of humor), have an
image problem, and not just with people waiting for their license but hams
of long standing.

They do provide a service though, and I would not seek to disuade anyone
from joining. I read their magazine and will likely join myself. I would
like to see them work on this problem.

BTW, The indivigual I spoke to was very helpful in providing all the
information available to him and I have no malice against any person at
the ARRL. If the department handling the paperwork needs help I would like
to see them get it.
I believe the SYSTEM is the problem, NOT the people!

>Perhaps that was rude

A better procedure would have been for the salesperson to take
down the information and call you back. But the salesperson
did the right thing in not keeping the customers in the store
waiting.

Radio Shack pays minimum wage (plus sometimes a small commission)
to its salespeople. It relies on young students and manager-wannabes.
Sometimes they know about the product line, but most of the time
they don't. The average sales clerk only works there for a few
months. It's the same at most other retailers.

I heard there was a group called the Global Voices Project,
KE6EG (Ed Addy) doing some work down Iowa. I know Ed, but haven't
heard from him. Has anyone run across these guys? Ed headed up the
Desert Voices Team here in Minnesota during the Gulf war. He most
likely be working the MARS/HF bands maybe also doing Salvation Army
and Red Cross Traffic.

I don't know his MARS call.

Thanks,

5485. fix for HT speaker resonance?

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-23 22:29:52 UTC
From: gsherwin@nyx.cs.du.edu
Message-ID: <1993Jul23.222952.20963@mnemosyne.cs.du.edu>
Source record: 278643
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

After a long flight with my HT in carry-on, I noticed an unusual amount of resonance that the speaker made with the plastic housing around it. It made for some REALLY annoying vibrations whenever someone spoke -- enough to make me want to get a new HT if I left it -- and so I opened it up, tightened a few screws, etc. It reduced it a lot, but the level is still quite noticeable. (Also, it's certainly not the speaker that's the problem, but the resonance it generates in the chassis.)

Has anyone had a similar problem and found a good solution to fix it? My HT is less than a year old and I'd hate to leave it this way, and I would rather avoid sending it in for warranty service to be without it for x months when I could probably fix it just as well myself.

Thanks and 73 --

>All the Yaesu VHF/UHF radios I've ever seen transmit out of band
>(140-150) so you're telling me my FT-5100 is illegal? I think not.

Perhaps the distinction is between rigs that can transmit out of band without modification and those that require a modification.

Most rigs I've seen can indeed transmit out of band, but one must snip a wire or a diode first.

I have been following this bushwa since day one. Sheesh!

At best, the clerk should have said something along the lines of, "I'm sorry, sir. I am terribly busy right now. Can you call back?"

Regardless, the customer should have realized that the clerk was terribly busy and asked, "Can you check this when you have time? I will call back later."

Remember the Golden Rule, radio pals.

I have a copy of the 1943 handbook. It has an interesting introduction,
dealing with amateur radio and the war. There ia a chapter devoted to
WERS, and construction articles for 5 meter gear (then called U.H.F.!).

I also have a copy, somewhere, of the issue of QST when the call went
out for panel meters. As a collector of WWII military surplus radio
gear, I have sometimes wondered if anything I own has one of these
donated meters installed in it.

I agree with this. More training should be given for emergency
communications. I believe it should be a part of the licensing tests.

However, during the Loma Prieta earthquake, we here in the area were flat
out swamped with H&W traffic. There were over 10,000 pieces of traffic
that passed through the area during the week after the quake. Untrained
hams did yeoman service in helping us clear the backlog. All it takes is
a desire to help and an ability to ask questions and learn.

> Even the ham portion of the emergency network is not properly exercised in

Field Day is A vehicle for training. Taking time to plan for Field Day is
a good exercise, IMO.

But, I agree that in most cases, FD is nothing but a contesting party.

> More hams really should become part of the official ham emergency groups. Mor
> hams involved with these groups would mean a larger pool of really trained

More hams should become a part of the unofficial emergency group -- NTS.
If, for no other reason, to learn how to handle emergency H&W traffic.

The NorCal NTS Net has published a handbook on handling NTS traffic. Email
me for details.

5492. Two-Line Orbital Element Sets (TLE232)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-24 00:32:57 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.743473977@afit.af.mil>
Source record: 278668
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

>
>Why was Amateur Radio shut down in WWI? Fear of Espionage? Why was it
>not shut down in other wars?
>
Fear of espionage, but mainly QRM. The receivers of the day
had selectivity we'd measure in MHz, and the transmitted
signal from a spark rig was about as broad. The Navy didn't
want the QRM. During WW1 you not only could not operate, but
you also had to dismantle your station and take down your
antenna.

Amateur radio nearly didn't survive the war. The Navy wanted
to control "wireless," and had no use for hams, despite their
contributions during the war. Hiram Percy Maxim, who was a
well-known inventor and the son of another well-known
inventor, was able to use his influence in government circles,
the extensive list of League members, and the efforts of early
hams in WW1, to win back our privileges.

Amateur radio was progressively shut down in the days before
the US entered WW2. At first, US hams weren't allowed to contact
hams in combatant countries. At least one ham was dinged for
working a D, the prefix for Germany in those days. When Britain
entered the war following the invasion of Poland, Canadian hams
became unworkable, as Canada was part of the British Empire.

Amateur radio was shut down altogether after the attack on
Pearl Harbor. W1AW stayed on the air for a while, telling hams
to QRT. A story I heard was, someone at Hq called FCC to see
how long W1AW should keep transmitting, and FCC said "You're
still on?!" A predecessor of RACES, the Wartime Emergency
Radio Service (WERS) was established for US-only civil defense
purposes. Hams who remained in the US sometimes joined WERS,
which operated on the old 5- and 2 1/2-meter bands.

Another way hams stayed active during WW2 was via "carrier
current," where HF was dumped into power lines. In rural
areas, power lines sometimes ran for many miles without
encountering a transformer, so you could get a little DX,
if another ham lived near enough.

Among other WW2 activities, ARRL coordinated the collection
of panel meters, for which hams were paid $1 each, I think,
by the government. Building meters was very labor-intensive.
QST articles constituted radio training courses, and special
editions of the Handbook were published.

Following the cessation of hostilities in 1945, amateur
operation was gradually authorized again. The military was
still using many ham bands for its own work, so a blanket
restoration of privileges wasn't possible.

One of the casualties of WW2 was DXCC. The world was so
changed by the war that the prewar Countries List was
scrapped, and everyone started over. Thousands of hams
served in some way during WW2, and I'm sure the military
was much more favorably disposed to hams after the 2nd
WW than they were after the 1st.

While US hams have never been totally shut down since
1945, for many years FCC had a list of "Banned Countries"
which US hams couldn't contact. Most of the banned countries
had banned amateur radio themselves, so it wasn't a total loss.

73, Jim

v111qheg@ubvms.cc.buffalo.edu (P.VASILION) asks:

>Need QSL info for

>V26AS (ARRL DX Feb '93)
>FY0EK (Feb '92)
>7L1GVE (most sure route, pse)

>Vice President, Western NY DX Assoc.
>Editor, _WNYDXA REPORT_

Wait a minute - you are VP of a DX Association and editor of a DX report, and you don't have a copy of the "GO list"? These routes are all in the latest issue (#158). Even we Medium Pistols subscribe to this.

This might be an unfair response, and you already know that these routes are not the ones you need, so I won't waste everyone's time by typing them in.

Gd dx to u es ur family es qsl sure via buro,

KH6 on 160m, Advisory #3. The effort by KH6DD and friends to energize an abandoned broadcast tower on 160m has again been postponed. It will NOT occur on July 24 starting at 0800Z as previously announced. The tower will be unavailable after July 28th. The group has not yet given up the attempt.

I'll post the details as I receive them.

Regards, Bob Hlivak NH6XO

: >In a perfect mixer, the output is the product of the two inputs:
: >Vout = A x Vrf x Vlo (Vrf = rf input signal and Vlo = local oscillator
: >signal). Clearly, in one sense, this is not a linear system.
: >For example, if you feed the same signal into both inputs (Vlo = Vrf)
: >the output is Vout = A x Vrf^2. If Vrf is a signal of frequency F
: >you will get out frequencies of F and 2F. (Proof left as an exercise
: >for the reader :=)

: Let's see the proof. :-)

OK, you asked for it! :=)

Let Vrf = sin(wt) [w is omega, frequency in radians]
Vrf^2 = (sin(wt))^2
= (1/2) (1 - cos(2wt)) [trig identity]
DC component---^ ^---second harmonic

Theoretically, you don't get any fundamental if the mixer is perfectly
balanced.

: In my day, we called such a circuit a *phase detector* and the only
: outputs for identical signals on both ports is a DC voltage proportional
: to any phase shift between the input signals, zero if they are in
: phase, and a larger copy of the input signal frequency as the two
: waveforms add constructively. If there is phase shift, you get DC
: plus a complex shaped waveform.

Actually, in a phase detector, the DC component goes to zero when the
two signals are 90 degrees OUT of phase:

sin(wt) sin(wt + 90deg) = sin(wt) cos(wt) = (1/2) sin(2wt)

Again using a trig identity. Note that the second harmonic is still
present, but the DC component is missing. The second harmonic is not
generally a problem with a phase detector, since it is easy to filter out.

I have some very good friends who have a couple of retail computer/surplus/salvage/scrap stores here in Arizona. They are opening their third retail outlet and want to expand their piece parts line to cater to the local university electronics crowd. They have asked me what a good basic starting assortment of components would be. They do not have the budget to go out and buy 25 each of every 74XXX part so they just want to hit the highlights, stock things that have a reasonable chance of moving.

Sooo.....

What would YOU want to see in a hobbiest electronics store? What do you find yourself regularly running out to get?

I, and they would appriciate and suggestions you may have. Seriously, when was the last time a retailer asked YOU what you would like to see on the shelves.

Thanks,
John

Notes of Interest:

The AH1A QSL cards arrived in Denver on 16 July from the printer in Belgium. All cards should be out by the end of September.

PRATAS Is. Bolon, BV5AF (President of CTARL) informs us that he will be the chief of the BV9P DXpedition. No definite date is fixed at the present. They are supposed to operate as BV0ARL/BV9P, where BV0ARL is the call of CTARL Chinese Taipei Amateur Radio League. The island is located abot 350 miles from Taiwan in the South China Sea. Mode used will be SSB, CW, AMTOR, RTTY, SSTV and also satellite with 12 operators. Stay tuned, more soon.

ANGUILLA. John, KA3DBN will be signing VP2EBN from 22 to 30 Aug. Operation will be on CW, SSB and RTTY from 80 to 6 meters.

PENGUIN Is/WALVIS Bay. James, DJ0WQ with DK2WH, DJ4LK and DJ2ZS will sign ZS0PI from 28 July till 4 August on CW, SSB and RTTY. James and DJ2ZS will then move to Walvis Bay from 6-28th August.

TUVALU Is. It appears T24JJ has concluded his stay in Tuvalu. He was spotted three times on local Packet Cluster (KE6XJ area) with a few RTTY contacts.

Send your bandpass and notes for next week to Bob,
WB2CJL @ CE3GDN.#STG.CHL.SA.

GL de (DX2) Luciano, I5FLN @ ZS5S.ZAF.AF

Just turn down the power on the hotwater 101 if you have the cw filter it is
a very good cw rig. I used one for a year in college apartments and no one
knew i was there except one retired airforce tech back for a degree notcied
he could here me on the telphone on 15 meters. And I was running 25 to 50 watts.
Set it for VOX operation and you will get simi-breakin keying.

Give it a try.

Good luck

ed@imp.pnl.GOV (N7YQR) asks:

>I recently got a card back from a contact with 4U1WB, the World Bank
>headquartered in Washington, DC. My question is: for DXCC purposes does this
>count the same as a qso with the UN?

No, it counts as the U.S.A.

>The ARRL DXCC Countries list shows two
>different 'countries' for the 4U1 prefix: UN Hdqrtrs in NA and ITU Hdqrtrs in
>EU. The reason I'm confused is that most callsigns are associated with a
>specific country and the 4U1 prefix isn't.

4U is allocated to the U.N., which of course is not a "specific
country". If you hear a station signing something/4U, work it -
it may well be Syria or somewhere else where there is a UN peace-
keeping force.

There is also 4U1VIC, but this counts as Austria. I'm not clear
why the UN building is a separate 'country' while the World Bank
is not, nor why 4U1ITU counts but 4U1VIC doesn't.

Of course, there are other prefixes that cover several countries,
like VP8 (Falklands, Antarctica, S. Shetlands, S. Georgia, South
Sandwich, S. Orkneys - all separate countries....).

>I realize I can just send it in with the next batch of
>cards to the DXCC desk and find out, but I just got curious...

Only do this if you don't have a W card...

Help! I have been studying nuclear magnetic resonance for the past two years (it includes a lot of RF in the 40 to 400 MHZ range) and want to join the ranks of Amateur Radio.

How does one go about this in an economical manner?

I have a RS PRO-2026 scanner (portabilized) and would like to know what freqs are good for someone like me who is interested in starting HAM.

What other news groups besides rec.radio.amateur.misc are good to run this post?

About how much would a basic starter set cost, what would it entail, and how long would it take to get a license (novice or tech)?

Does anyone know of HAMs in the College Station - Bryan TEXAS area who would be helpful?

If anyone is patient enough to answer these questions, I would prefer replys directly to my e-mail. Any advice would be greatly appreciated!!!!

Tim Skloss internet: TSKLOSS@venus.tamu.edu

Thanks in advance!

Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur,rec.radio.info,rec.radio.amateur.packet

Good morning. It's Sunday the 25th of July and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The RSGB's featured once again on the BBC; the 1994 RSGB President has been elected; and the North Devon UHF repeater is off the air.

The RSGB has once again been in the forefront of publicising amateur radio in the media. Broadcast last night on the BBC World Service was a programme called Waveguide which featured amateur radio and the RSGB's role in the hobby for the past eighty years.

The Council of the RSGB has elected Ian Suart, GM4AUP, President for 1994. Ian is well known for his work as Zonal Council Member for Scotland, and his Chairmanship of the Data Communications Committee.

GB3ND, the North Devon seventy centimetre voice repeater on RB14 is currently off the air and will be out of service until the NTL engineering work on the site is completed. The North Devon Repeater Group apologises for any inconvenience caused and will keep users informed of developments via GB2RS. For further information contact the repeater group secretary G3PGA whose address is correct in the RSGB Call Book.

The RSGB has announced details of this year's elections to the Society's Council, and for the RSGB liaison Officer scheme. Full information appears in the August edition of Radio Communication which is being sent to all members this week.

Due to unforeseen circumstances the venue for the Torbay Mobile Rally, scheduled for Sunday the 29th of August, has been changed from that advertised. The new venue is the Audley Park School, Barton Road, Torquay. Further details from G3HTX on 0803 526762.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Tuvalu, WB6RZK will sign T26RF from Wednesday the 28th until Tuesday the 3rd of August. From Liechtenstein, DL5DCM and DL6DCM will sign HB0/own call from tomorrow the 26th until the Friday the 30th of July on SSB only. From Hong Kong, G0TBI will be active as VR2/G0TBI from Friday the 30th of July for 14 days. Check CW frequencies 14,017 and 21,017kHz and SSB frequencies 14,245 and 21,245kHz, all plus or minus QRM.

We know of five rallies taking place today Sunday the 25th:

The Colchester Radio & Computing Rally is being held at the St Helena School, Sheepen Road, Colchester, which is adjacent to the Colchester inner by-pass, Avenue of Remembrance. The venue is signposted from the A12. Doors open at 10am and there is easy access for wheelchairs and ample car parking space.

There will be trade stands catering for radio and computer needs as well as components suppliers. The event also features an amateur radio car boot sale and a bring & buy stall. Morse test will be available on demand, but candidates should remember to bring two passport-type photographs. Talk-in will be on channel S22.

The Norfolk Amateur Radio Club and Hewett School Radio and Electronics Group Rally is being held at Hewett School, Norwich. Doors open at 10.00am. There are trade stands and a bring & buy stall plus various displays. The venue is described as suitable for all the family.

The East Yorkshire Radio Rally is being held at the Beverley Racecourse, North Humberside. Doors open at 11.00am, or 10.45 for disabled visitors. The rally features trade and special interest group stands and a bring and buy stall. There will be model aircraft displays through out the afternoon. The organisers regret that unforeseen problems have prevented the running of Morse tests at this event. The revised schedule is now: at 12 noon the East Yorks Repeater Group will give a lecture, then at 1.30pm there will be a lecture by the East Yorkshire Packet support group. At 3.00pm the RSGB RLO and General meeting takes place. Talk-in is on channel S22 via GB4EYR.

The Radio Amateurs Invalid and Blind Club's Annual Romsey Picnic is being held at the Broadlands, Romsey, Hampshire. The event features the usual attractions, plus a junk sale, a bring & buy stall, refreshments and a grand draw. All members, families, friends and supporters are welcome. Talk-in will be on channel S22.

The Rugby Amateur Transmitting Society fifth Annual Rugby Radio Rally is being held at the BP Truckstop on the A5, some 2 miles North from junction 18 of the M1 motorway. Traders and visitors are welcome from 8.00am. The truckstop will be open for catering and other facilities throughout the day. Talk-in will be on channel S22 by GB5RRR.

We have been notified of only one rally for Sunday the 1st of August:

The McMichael Rally and Car Boot Sale is to be held at the Haymill Youth and Community Centre, Burnham Lane, Slough. The Centre is near the Burnham railway station. Starts at 10.30am. Talk-in will be on channel S22. Details from Neil, G0SVN or Roy, G4XYN tel: 0628 25952. This rally was originally scheduled for the 18th of July.

HF contest news now:

The first ever Islands on the Air SSB Contest started yesterday Saturday the 24th and finishes today Sunday at 1200GMT on 3.5 to 28MHz. See March RadCom page 81 for full details. The RSGB RoPoCo-2 Contest will take place next Sunday, the 1st of August from 0700 to 0900GMT between 3520 and 3570kHz CW only. See February RadCom page 66 for contest exchange information.

VHF contest news:

The RSGB 432MHz Low Power Contest is taking place today Sunday the 25th from 0800 to 1400GMT. It features four entry sections: single operator fixed,

single operator portable, all others and short wave listener. February RadCom on page 66 has further details of this event. The RSGB's 2nd 432MHz Fixed Contest is scheduled for Sunday the 22nd of August. See February RadCom page 67 for further details.

A special event callsign to look out for this week is GB0PG. This is the Pinkneys Green Scout Group from Maidenhead, Berkshire operating during the Groups Annual Camp at Tregate Castle in Monmouth from Saturday the 24th of July for one week. Guests of the group at the camp will be 30 Hungarian Scouts and Leaders. This is part of a two-year project which aims to assist in the redevelopment of Scouting in Hungary and to encourage international friendship through Scouting and Amateur Radio. The Pinkneys Green Scouts, who have raised over 10,000 in eight months to support the project, will travel back to Szombathely {pronounced Sombatey} Hungary in 1994. The operators of GB0PG are Peter and David Roberts, G0JPE and G1BPV respectively. Operating frequencies are 3,740, 7,090, 14,290, 21,360, 24,960 and 28,990kHz as well as 2m and 70cm FM and SSB. Contacts with any station are welcomed, especially so, if connected with Scouting or with Hungary.

And here is the solar factual data

For the period from the 12th to the 17th of July, with the quiet side of the sun looking our way, solar activity has been low. Nothing of any note has been reported. We are short of Meuden data this week so most is USAF/NOAA data. No flares have been reported. The sunspot count has meaned about the 90s. Solar flux levels tended to increase slightly from 86 units on the 12th up to 100 units by the 18th, with the period averaging 91 units. Geomagnetic activity has declined with the period becoming quiet by the 14th with the Ap indices dropping to only 2 units. The period averaged 6 units; the state has been 'nil nothing to report'. We do not have all the radio quality index data to hand, but what we do have indicates that on the 13th to the 15th of July levels were normal, with all circuits being much the same. The aa indices are not to hand this week. The X-ray flux recovered from only A5.3 units on the 12th up to B1.3 by the 18th with the period averaging B1.0 units. The smoothed monthly values for December 1992 are: Spots RI 73.2; flux 127.3; magnetic Ap 16.2. Bartell rotation 2158 begins on the 21st of July.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, are also incomplete this week. For the 12th to the 15th of July the daily highs average 7.5MHz and the darkness hour lows 4.1MHz. The 15th was marked by seven hours of blanketing Sporadic E.

Now the ionospheric data for the north:

Again we have limited data. For the period 12th to the 15th of July the F2 daytime critical frequencies at Ekaterinberg averaged 6.2MHz and the darkness lows 4.8MHz. Cycle 22 has caught out the forecasters on a number of occasions, so for what it is worth the latest forecast for spot minimum is May 1996 with a smoothed count of about 6, but in fact the cycle is declining very quickly and could well finish ahead of the forecast.

And lastly the solar forecast:

This week the more active side of the sun will be coming into view. Solar flux levels are expected to be about 100. Geomagnetic activity could be unsettled due to the passage of a coronal hole. Ionospheric levels based on the radio quality indices are expected to be normal at first then declining as the week goes by.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T X and G7 O Y series, and Novice calls in the 2 0 A G and 2 1 C C series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Having read his opinion I thought NO WAY! Those folks at ARRL know what it's
like to wait around for the government to move forward. They will move
heaven and earth to get the paperwork to the FCC ASAP.

NOT!!!!!!!!

I called the ARRL VE info number, 1-800-9ARRLVE.

The local testing group sent the paperwork in promptly, by overnight mail.

The Anally Retentive Regulation Lovers hung onto it for 17-19 days!

I quote the ARRL representative,
"The laws allows both the local VE's and the ARRL to take upto 10 DAYS each."

Not only did the ARRL use it's 10 day allotment but sucked up the field VE's
as well.

As you may have noticed, I am not impressed!
Their representative reminded me of how much faster and more efficient they are compared to the FCC and reccomended that I call my Congressman and ask for more money for the FCC. That, said he, will speed things up.

I am not going to hold my breath waiting for the government to speed ANYthing up no matter how much money they get.

My "positive" sugestion:
The ARRL should be a different story! If they need more people, I for one would cheerfully double, triple, or quadruple the $5+ dollar fee for testing if it got the damn papers shuffled expeditiously!
You can't buy a rubber dummyload for your HT for $20. What's $20 to whack 2-3 weeks off of the already interminable wait for your license.

I had made a commitment to help provide emergency communications at an upcoming event. I prefer to keep my commitments, but I don't seem to have any options this time.

See topic "STILL waiting for your license?"

5505. Question About Kenwood 742 Remote Access

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-24 09:29:41 UTC
From: easu348@orion.oac.uci.edu
Message-ID: <easu348.743505860@orion.oac.uci.edu>
Source record: 278677

This might sound confusing but here it goes...

A friend of mine is having problems with the remote access feature on his Kenwood 742. He has the instructions strait from Kenwood, but apparently, the radio needs a modification to perform the remote access without physically turning the remote control feature on AND off at the radio.

Can anybody tell me if it's true that it needs a modification to perform this feature without turning it on and off from the 742 itself? If it does need a mod., how difficult is it, and could it be easily explained? If it does not need the mod., how do you do this function?

I hope that wasn't too confusing. Thanks VERY much for any responses!

I have been trying to get into NTS and message handling, but I still
can't find a NTS net!!!
I have only have 20 (and very, very soon 40) meter capabilities, but I
haven't been able to find any NTS net. And I don't think there is any
kind of traffic net around my area.
I live in Las Cruces, NM , about 40-45 miles from EL PASO, TX. I
would like to get some frequencies for NTS nets on either 20 or 40
meters. Does any active traffic-handler have any info on this???

There are synthesized GMRS radios, but they are required to be constructed such that the end-user can not change the fereqency assignments. In some cases, an external programming key such as a small pushbutton on a cord is used to unlock the keyboard. Other units use an unlikely and undocumented keyboard sequence to enter programming mode. A third method is to use a personal computer program that communicates with the radio via a serial cord.

Spring of 1937. The Ohio was 31 feet above flood stage. It made what's
happening now look like nothing. And the winter of 36.... you could
drive 20 ton trucks across the Ohio. Brrrrr.

5510. What gives, 20/20? (was: ABC Perspective on Amateur Radio)

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-24 15:03:32 UTC
From: jmiller@walt.afit.af.mil
Message-ID: <JMILLER.93Jul24100332@walt.afit.af.mil>
Source record: 278584

Our local ABC Radio Network affilliate, WBAP, ran a program called
Perspective by Hugh Downs last night at 11 pm. The first 15
minutes of the program were devoted to amateur radio. It was a
very good commentary on ham radio. If you get a chance, you might
contact ABC News in New York to get a tape for local rebroadcast
and for club meetings. I don't know whether they will supply it,
but I am going to try.
Write to:
Perspective
c/o Jim Farley
ABC News
125 Westend Ave.

73,
Pete WB0FEW

That's very interesting, in light of the fact that last night's 20/20
had a 15 minute segment on Barry Goldwater, K7UGA, and *not once* was
any of his involvement with amateur radio discussed. They found a
couple of minutes to talk about his model airplane collection, but
zip about ham radio. I had to work pretty hard to discern the back
end of a tribander in one of the outdoor shots. What makes this even
more interesting was that Hugh Downs was the interviewer for the
segment.

I'm quite puzzled. Certainly Mr. Downs is aware of K7UGA's ham radio
activities, but didn't mention them at all, not even a passing
reference. Could it be that K7UGA is embarrassed to call himself a
ham? Don't think so -- a local ham told me yesterday that he had
just returned from Arizona where they filmed an AMSAT promo with
K7UGA. So, what else could it be? Any conspiracy theorists out
there want to take a whack at this?

Folks, we just lost a free national exposure opportunity for ham
radio. I would think a few letters to ABC would be in order.

When the Desert Storm operation startup up, I noticed that most satellite distributed transmissions developed audible chirps and beeps. These included AM radio news, PBS, CNN, NBC, ABC, CBS. These spurious noises continued for several days. I suspected piggyback transmissions of some sort at the time.

When I first got my satellite dish, the possibility interested me so I performed a few simple calculations. If one reduces the bandwidth from video to voice level, the antenna gain requirements reduce proportionately. I estimated that CW bandwidth needed only a omnidirectional antenna and only a few DB gain required for voice communication.

The views expressed here are my own, not my employer's.

Greetings...

I've started work on an article for QST that describes the
DTMF Squelch systems that are included (or available as options)
for some of the more recent imported VHF/UHF handhelds and mobile
rigs.

After using these things for several months I've formed some
opinions about the good, the bad and the ugly aspects of these
systems. I'd also like to hear what you think about them.
Please let me know of your experiences: what works, what doesn't
work, what you like, what you don't like, how it could work better,
etc.

I've got a pretty short fuse on this so it would be most helpful if
I could have your input by August 1. Also, please send email directly
to me, rather than posting it here. Feel free to post it here if you
want, but I would be grateful if you could also send me a direct
email.

Thanks for your consideration.

Not so fast, Alan. You're correct, of course, for the class of circuit you're talking about, but there are a number of things called "phase detectors" for which the above is not true, so you're running the risk of confusing some people here. For example, most phase detectors in a "digital" PLL circuit are built such that the DC output is a minimum when the inputs are in phase (i.e., the edges are locked). The simplest example of this I can think of off the top of my head is the use of an XOR as a phase detector in such a PLL.

Short: Any net experience on running roof cables in older model Accords??!!

/Alan Paeth
VE3AWP/KD3XG

--
Longer: My second car is now old enough that I've taken Gary Coffman's advice
on drilling the roof (well, I used a 3/4" punch). Dampening my enthusiasm:
How to get the !@#$#! coax from the dome light to the dash?! I've tried to
snake over it to the BC antenna and continue in the nice channel waiting there.
I gave up after a few hours of coat hanger pulling. I don't want the coax
draped above the headliner if I can help it, nor do I want to drill any
exterior holes (ie, into the roof-rack gutter).

5521. Create LP antenna opinion

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-25 01:49:30 UTC
From: brett@micromed.com
Message-ID: <89Z87B2w165w@micromed.com>
Source record: 278596

Someone recently asked about opinions on the wide range Create Log Periodic antenna. It is a great antenna if you dont mind using a directional antenna and you live in a friendly RF environemt. I say this because the antenna gain of this antenna will also amplify the unwanted pager and FM broadcast stations. So if intermod is not a problem, then this is a great antenna, otherwise, you may want to consider soemthing different. Personally, I think the best way to go is to get separate directional antennas for each band you are interested in. This method introduces some connection complications, but for a good signal, it can't be beat.

Hi,

I am hoping that someone here can help me
with a radio problem.

I have a Kenwood TS-120s that I bought used
from someone. The radio has worked fine
for the last few days but is now having
a problem.

There is no audio and no frequency is displayed
on any band. Instead, the display shows
only 2 periods. I have checked all settings
including the fix button and everthing is
set correctly. Has anyone else ever had this
problem with the 120s? If so how do I fix it?

Thanks.

> the dbm scale?
>
> 3) Was it started by an amateur proposal, or perhaps a manufacturer?

My fuzzy memory says Collins introduced the S scale in the late 1930s or early 1940s. The scale originally topped out at S9, the +db part was added later. That's because 50 uV was considered a very strong signal in those days when most hams were running 100 watts plate *input* power, or less. Only a very few wealthy hams had higher power equipment. The scale then descended in 6 db steps to S0, a signal inaudible on most receivers of the day due to internal receiver noise. The S scale was intended to be a more objective replacement for the old S in RST. Even in those days, DXers all gave 599 reports if they needed the card.

It was common amateur practice in those days to deal with signal levels in microvolts rather than the more exotic dbm. Since 50 uV was a nice round number, and easily generated and measured with the equipment of the day, it was chosen rather than 45 or 63 or some other odd number as the reference level. Collins equipment of the era was accurately calibrated to this reference level(+/- 3%). Most radios of the era that were bandswitched, many were single band, did so by physically plugging coils or entire modules in for each band. Some even had plug in tuning scales. Whether it was intended for there to be plug in calibration modules for each band or not, I don't know. I've never seen one.

Got the good call, Scott, but not a copy of the FCC rule book? Doesn't
seem fair....

Subpart A - General Provisions:
Part 97.3.Definitiions.a: (10) Broadcasting. Transmissions intended for
reception by the general public, either direct or relayed.

Subpart B: Part 97.111.Autorized transmission.b goes on to list authorized
"one-way" transmissions (not broadcasting by definition) and includes
(5) Transmissions necessary to assist persons learning, or improving
proficiency in, the international Morse code;
(6) Transmissions necessary to dissemenated information bulletins; ...

Subpart C - Special Operations, 972.203, explictily provides for beacon
operation.

Anyway, the FCC is pretty specific (unless they're being purposely obscure!)
about what we can and can not do. Anyway, broadcasting _as defined_ is
illegal. There are plenty of one-way moded that are not, including all
kinds of fun things like remote control, telecommand, telemetry...

Singed, Much to late to get a good call...

I've just done the deed on an older S10 Blazer (87), and an even older Camaro (83). On the Blazer, I removed the trim holding the headliner in place, removed the headliner, and ran the cable over to the B pillar and down into the door threshold wiring channel, then I reinstalled the headliner. (Easy)

On the Camaro, the $%&# headliner was glued in. I used a real electrician's snake rather than a coathanger to force a path alongside the dome light wiring over to the side pillar. (Coathangers are too flimsy to do the job.) There I removed the trim and routed the cable down the wiring channel. I've never done an Accord, but I expect you need to remove trim in order to get the cable into the wiring channel. You probably want to route it to the B pillar and down from there to the wiring channel under the door threshold trim, and from there up behind the dash. Trying to go directly over to the windshield pillars usually doesn't work.

Sigh. I'll be operating from the elusive and rare grid FN13. Well, me
and dozens and dozens of other hams... It's real treat for me to give
out this grid to someone for the first time. The Rochester VHF group
is so very active and they DID get me into contesting (I LOVE IT!)
but this must be the most overworked grid in the world!

Anyway, I'll be on 222 (FM only), 432, 1296 and (for coffee table contacts)
10 Gig.

Exactly! I am getting into amateur radio mainly for the digital
modes now available. That I will be licensed, for example, to work
satellites and to transfer data across the world, by organizations that
can't even integrate a land-line modem or fax machine into their
process is pretty silly. I've been hearing a lot of people saying that
we don't appreciate the "complexity" in the process; but is all this
complexity of trimming forms, going through Airborne Express, having
everything checked manually at three different geographic locations,
etc, etc, really necessary?
Perhaps this sort of thing is part of the reason many of my
friends like to call amateur radio the "IRC of the seventies." (If you
don't get this, don't worry about it - suffice it to say that it
something of a disparaging remark.)

5531. Alinco DJ580T woes and MCF...

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-25 19:53:46 UTC
From: hemstree@cs.colostate.edu
Message-ID: <HEMSTREE.93Jul25135346@handel.cs.colostate.edu>
Source record: 278605

I bought a DJ580T one year ago today. It has been a pretty good radio
up until last month when it fried itself. Here's the description for
$78...

Repaired broken antenna connection.
Replaced intermittent 2nd LO XTAL
Replaced D111 PWR selection and control
Aligned and tested...

My radio was intermittently putting out 8watts. No wonder my radio
was getting so hot! Throughout the whole fixit stage, Alinco was very
unwilling to give us a straight story on how long my warranty should
last. I got two stories, one year, and two years... Anybody know for
sure? Alinco doesn't. Anyway, whether it was under warranty or not,
the radio is fixed and I am happy with it once again.

Helpful hint: Go gentle on the antenna bnc. I use an AEA Hot-rod for
two meters, a Diamond RH-77ca for handi-dual-banding, and a magmount
for mobiling around. The connector wasn't all that solid on my radio
but my changing of antennas (three or four times a day) was what killed
the internal antenna connections.

Now the MCF function... has anyone seen this in the newer Alinco's?
Is there a mod that can be performed to get my radio to function with
this new VHF-VHF, VHF-UHF, UHF-UHF function?

Thanks for any help,
Charles

Let's put this thread about VEC's taking too long into the proper perspective. The last time we gave exams it took 10 calendar, not working, days from the day of the exam until the ARRL, in this case, sent the materials to the FCC. That included mailing time and a weekend. The VEC's, for better or worse, only account for a small fraction (20% ?) of the time from the day of the exam until the arrival of the license. Pick on someone else.

Source record: 278606

Gang,

just a quick report on the trip to "Ham Holiday" the swapfest in
Oklahoma City OK. somebody has to drive north on I35 aperiodically
to make sure the Red River is still there and i'm here to report
that it still is. :-)

i just went up for Saturday, which was long enough for me to part
with some of my money.

i had reported last year on the net, when there was flame wars
going on for MFJ products. i don't think that i'll ever learn.
i'm already educated beyond my intelligence anyway. just had to
go and buy a couple more critters........ :-)

MFJ-451 Morse Keyboard - A Review by Chuck Adams K5FO

i normally use either a Heath Ultrapro Keyboard or when i'm
practicing on the Bencher i use an AEA MM-3 or CK-2 keyer.
the heath is losing one of the memory chips for the 10 memory
buffers and i hadn't taken the time to fix it, so i saw the
MFJ-451. thought, what the hey, it was reduced i'll just buy
one. replace the large AT keyboard with the small one i have
on a 386 and take up less space (vertically and horizontally over
the heath ultrapro) on the operating desk.

the MFJ-451 keyboard has an unmodified keyboard (AT type) that
plugs into a small box (sorry, i'm at the office and don't have
the exact size). got it home, opened the box, plugged it in,
and it worked outta the box. didn't even have to read the
instructions. only two parts and parts is parts, right?

ok, get the instructions, get through them in short order and
know how to set the speed, load the two buffers, adjust the tone
(the volume controlled with a knob on the little processor box),
learn to program the beacon operation up to 99min 99sec delay,
and use the serial numbering in time to use it for SS. :-)

ok kids, so far so good. fire up the QRP rig on 40 for the sunday
morning schedule and call cq. get another qrp in st louis mo.
worked about 20 minutes at 30 wpm and stood by for the OK QRP group.
no answer and the other guy signs.

fine. so far so good. ok, 40 not all that hot, let's go up to
30 (another fine QRP band). WHOW BUCKAROO!! it is very very
obvious that noone at MFJ works 30 meters. this little keyboard
sucks canal water when it comes to putting out trash on 30 meters.

it's S9+ and then some. i can't hear the digital guys above
10.110 with this thing on. ;-)

ok, look at the schematic. uses 80C32 Intel processor clocked at
10 MHz. only decoupling caps in the system are four 0.1uF
caps. bad news. ok, i'll help, give me phillips. two screws to the case
and its apart. hey, nice little board, double sided silk screened
plated through solder masked. not bad. ok, three more screws to
remove board and a model airplane prop-nut driver to remove volume
control nut. board comes out and i turn it over. GEEEEZ!!!
we have 12 year olds learning to solder here or what? the second
worst soldering job in the world that i've seen. you guessed it
the first place is the MFJ-249 HF/VHF SWR ANALYZER. see second half
of this posting.

i take pride in my work, no matter what it is, and i'd think that
others do too. component leads were not cut short and overlapped
PC board paths and on and on i could go, but i won't. board looked
dirty and the solderplated holes looked oxidized (they were).

it works, but once again, bad quality control for cosmetics. if it
works, ship it!!!

if you plan on working 30 meters, do not (and i repeat) do not
buy this keyboard until you hear from me that they got the problem
fixed. i thought that i'd play with some ferrite beads strategically
placed, but no way am i going to spend my valuable time doing this.
going to call them on monday and ship the little box for a revision.
or else.

i didn't pay the $89.95 list price and got a good deal, but not
that great to have something in the shack that readiates more than
the rig (or so it seems).

MFJ-249 HF/VHF SWR ANALYZER - A Review by Chuck Adams K5FO

this is the deluxe swr analyzer by MFJ. list price of $199.95, which
of course i didn't pay at the swapmeet. :-)

i had asked the qrp mail group about these and got a response after
the fact and as it turns out, i made the right decision. we all get
lucky once in a while.

MFJ has another analyzer MFJ-207 which is the same without the
frequency counter. i have a heath counter, but i prefer to put
all my eggs in one basket and have a small self-contained unit
like the 249. once again, outta the box, hook up 12V supply and
fire it up. worked first time every time. hook it up to the 80
meter long wire and check it out. GREAT. with the digital readout
for frequency and the analog meter for direct reading SWR, it's
very easy to see where you are and how good the antenna is doing.
checked all the bands from 160 to 10 Meters. i had my previous
settings from measurements made at 1 watt with Oak Hills QRP wattmeter.

they were correct (of course). but, the MFJ makes it very easy. none
of the forward vs backward, etc. just read it and weep or smile.

one of the questions i asked the friendy sales rep was "how much RF
does this little puppy put out?". it obviously must generate rf
to the antenna to get the swr. he didn't know and the MFJ manual
does not say one word. so, couple of pieces of RG58U with PL259s
and in goes the OHR QRP WM-1 meter. 2mW (that's 2 milliwatts) out
from 1.8 to 170MHz. constant and true. good news as that is the
requirement to not have an adjustment for meter calibration.
i wouldn't part with the OHR for love or money. need it for
power measurements for 10 W down to 1 mW.

i assume, since the MFJ-249 device transmits outta band (i did this
into a dummy load guys and girls and FCC) i assume that it is
type accepted or something like that. being an avid QRPer, i
know what 2 mW can do when the bands are right. and outside
of the ham bands you can easily get a clear frequency. ;-)
that why the HT mods i see posted here in rec.amateur.radio.misc?????

frequency meter is accurate as tested with heath counter and
3.600000 output from the wwv clock. without the counter (the 207), MFJ put
dial with freq markings and i understand from another individual
that has one, they aren't all that great. not good if you're tuning
an antenna from phone down to cw band or whatever. the digital display
(LCD) on the 249 is nice and handy to have.

ok, let's look at the schematic? what, no schematic in the booklet
or box!! ok, take the back off. BIG mistake big mistake (line from
Pretty Woman, the movie). the worst soldering job i've seen. tied
with MFJ-815B Cross-Needle 1.8-60MHz SWR/Wattmeter. close behind
is the above keyboard system. somebody in QC at MFJ outta work on this
or maybe start selling them as kits. i can do a better job easily.

the counter is SMT (surface mount technology and i assume it was
wave soldered) and separate from the badly soldered board. another
board also SMT and wave soldered for RF generator. at least i hope
so. i didn't want to see any more and put it back together. if it
works, Adams' DFW (don't fool with it) rule. :-)

so, final results. MFJ-249 SWR Analyzer. good deal. MFJ-451 keyboard
is a bad bad idea. wait til Christmas or later on this keyboard.
both are new items and maybe with feedback we can get MFJ to do
a little better.......

According to a source at the local HRO, who was "officially" unable to comment n the situation, the FCC recinded the fines the day after they were issued. Apparently after reviewing things they determined that no violations were committed. Another case of a government agency jumping the gun.

DOVE RECOVERY EFFORTS STARTED

HR AMSAT NEWS SERVICE BULLETIN 205.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 24, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-205.01

DOVE-OSCAR-17 (DO-17) Recovery Efforts Started This Week!

DOVE ground station control operator Jim White (WD0E) accomplished a major first step in the recovery of DOVE-OSCAR-17 (DO-17). With the assistance of Bill McCaa (K0RZ) thirty miles away, WD0E was able to send commands and listen to the results using an phone-patch between him and K0RZ. K0RZ's station, using a 4 ft diameter Mode-S dish and a NIR-10 DSP unit, was the S-Band "ears" for WD0E. Using K0RZ's excellent S-Band set up, WD0E was able to send commands and listen to DOVE's reponses quite clearly. The first command that WD0E sent was what he refers to as the "fire-code." This immediately reset DOVE's on-board computer to its most basic operating system software known as MBL. MBL is stored in DOVE's computer in Read Only Memory (ROM) chips. After having verified that the computer had re-set, WD0E then sent several commands to turn-on and then off the S-Band transmitter to be sure that the Telemetry and Command (T&C) system was functioning. After having confidence that DOVE was hearing the commands and reponding correctly, WD0E then commanded DOVE to send 30 frames of telemetry on its 2M downlink frequency of 145.825 MHz. While the 30 frames of telemetry was being sent, K0RZ was simultaneously recording and decoding it. WD0E points out that the major significance of this first step was that it assured him that DOVE's primary systems were still in good shape and that the receivers and transmitters were working normally along with the T&C system. From this point onward, Harold Price (NK6K) will proceed to reload the "house-keeping" software. If necessary, K0RZ has volunteered his station to assist in the DOVE "house-keeping" software reload oper-ation. With this sucessful first step, WD0E is very optimistic that DOVE can not only be restored to full operation, but it can be made to "speak" and perform its primary mission of education. Please stay tuned to the AMSAT News Service (ANS) bulletins for further updates on the status of the DOVE recovery effort.

[The AMSAT News Service (ANS) would like to thank Jim White (WD0E) for providing the details of this bulletin item.]

CALL FOR PAPERS

HR AMSAT NEWS SERVICE BULLETIN 205.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 24, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-205.02

Call For Papers For the AMSAT-NA Space Symposium OCT 8-10

The 1993 AMSAT Annual Meeting and Space Symposium provides a unique opportunity for you to share the valuable experiences you've had over the past year with the rest of the amateur satellite community. The AMSAT enthusiasts of North Texas are working hard to make the 1993 meeting a "smashing success." But it can only be successful with your help. This is a call for papers to be presented and published in association with the Symposium this year.

If you would like to submit a paper, simply compose a short abstract describing the purpose and scope of the paper. Abstracts are due by July 30, 1993. The final draft of the papers are then due by August 27, 1993.
Please mail all submissions to the address below.
Presentations and technical papers are the meat of the AMSAT Annual Meeting and Space Symposium. Even if you will not be able to attend, please consider writing a paper for publication in the proceedings. Help us make this year's Symposium one to remember.

Doug Howard - KG5OA
2517 Coldstream Drive
Fort Worth, TX 76123

EME CONTACT FOR OSCAR USERS

HR AMSAT NEWS SERVICE BULLETIN 205.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 24, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-205.03

VE3ONT Provides EME Contacts For OSCAR Satellite Users

The Toronto VHF Society, using the callsign VE3ONT, will use the 46M (150 ft) diameter radio telescope at Algonquin Provincial Park (grid FN05xw) during this year's ARRL International EME Competition.

VE3ONT will be active the full weekend of each contest period, October 9-10 and November 6-7. Below is the schedule of operations:

Date VE3ONT TX Freq. Listening range Approx. times (UTC)

Oct 9 432.050 432.050 - 432.060 0445-1830
Oct 10 144.029 144.025 - 144.030 0550-1900
Nov 6 432.050 432.050 - 432.060 0340 1700
Nov 7 1296.050 1296.050 - 1296.060 0450-1730

VE3ONT will operate "split" and we ask that stations avoid calling us on our transmit frequency. VE3ONT will transmit and receive with left-hand circular-polarization (LHCP) off the dish on all bands. This means that after reflection from the Moon, signals will be right-hand circular polarized (RHCP). This will permit us to work stations with vertical, horizontal, or RHCP polarization. VE3ONT will transmit at the legal power limit on 144 and 432 MHz and 100 watts on 1296. Power amplifiers and receiving preamps are located at the dish feed.

As users of a non-amateur antenna, we will not be in competition with other stations. Our intention is to provide an initial EME contact for as many stations as possible. Consequently, we strongly discourage duplicate or "insurance" contacts. Operation will be primarily on CW, although SSB might be employed depending on signal strength and number of stations calling.

All operation will be "random" format, meaning that VE3ONT will accept no skeds. If conditions are poor, we will use a 30-second sequence in which VE3ONT transmits the first 30 seconds and listens during the second 30 seconds of each minute. Note that this is NOT the usual sequence for EME skeds.

VE3ONT will maintain HF liaison on 14.345 MHz during daylight hours and on 3.818 MHz at night.

We anticipate being able to work OSCAR-class stations with 100 watts of output power on 144 and 432 MHz; 25 watts should be sufficient on 1296 MHz. Photographs and technical information concerning the dish and VE3ONT's operation will be presented by W9IP and VE3ASO at the Central States VHF Conference and the Eastern VHF/UHF Conference.

For clarification, contact Dennis Mungham (VE3ASO) (613) 998-7330/989-2339 or Michael Owen W9IP (315) 379-0161/379-5975. QSL to VE3ONT (Callbook address).

Ok, so is the TS50 legal to sell to HAMS?

I was in the radio store today, and the guy had a TS50S forsale, $999. Is
this the same radio, or is there a different version (ie lacking the "S")

>|Because the FCC correctly assumes that the hams would not stay within the
>|4 watt output limit.

>Why? Do most hams violate all the other limits they have?

Not most hams, because there is little temptation to do so - they already have "powerful enough" gear within the power limits on amateur bands (though I have heard a few Technician stations on 10m remark that they were running a kilowatt).
And then there are the band edges on field day, for hams who managed to pass their exams without getting the right answers to the signal bandwidth questions...

Since the amateur bands largely allow high power and are self-policing, hams must lie in the beds that they have made... there is no self-policing on 11m and thus no incentive to abide by rules other than the threat of FCC fines, which are (or "should be") easy to inflict because of the simplicity of enforcement facilitated by type-acceptance requirements. Certainly 11m has gone to hell in a bucket because of lack of enforcement (and poor planning - 4 watts and short-range communications restrictions on a band with *that* sort of propagation? Feh!) - but don't expect the FCC to announce total surrender by removing all restrictions.

But more simply, you'd expect a large majority of hams with 100 watt transceivers to sit there at 4 watts while the party they were talking with reported that they couldn't quite hear everything they said? If so, you have more faith in the masses than I do.

Apologies if this has already appeared, but my last posting seems to have fallen into a "black hole!" Anyway, here goes again;
I wonder if anyone can confirm or deny the apparently rather poor 3rd order transmit IMD products that were reported on this radio in a "Rad Comm" review recently. They claimed a measurement of -24dB on some bands to a worst case of -16 dB on 14 MHz! I'm just wondering if ALL TS50's are like this, or whether it was a faulty unit. I can't even check the specs on the "glossy brochure, as no-one has any brochures it seems. Radios yes, brochures no! Thanks..

>And surface mount boards are much easier to troubleshoot. There
>are no hidden connections. All you need is a sharp probe to test

Agreed that it's hard to remove through-hole devices from multilayer
boards, but most SMD boards I encounter are also multilayer, so
test access is no easier than for the through-hole version.

I've tried most of the rework techniques on through-hole boards that
have been mentioned in this thread, and been fairly successful.
However, I've always had problems with connectors, especially those
(like DIN 41612 connectors, and IDC headers) that have a large number
of square posts that fit closely in the holes.
I wonder if anyone's found a successful technique for removing them,
especially without damaging the PCB ?

5549. MFJ-451 Morse Keyboard

Newsgroup: rec.radio.amateur.misc
Date: 1993-07-26 12:59:50 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <CArw3r.99A@odin.corp.sgi.com>
Source record: 278624

After coming into the office yesterday afternoon and posting my
reviews (see yesterdays news) i returned to the ranch and played
with the new toys.

i decided to isolate the problem with the morse keyboard. i was
having serious problems with RFI (radio frequency interference
for the newbies) on 30 meters (10 MHz band from 10.100 to 10.150MHz).

took the keyboard off and the problem went away. so it's not the
microprocessor in MFJ's box that is directly causing the problem.
it's the AT keyboard. next step (i did have to get on the air and i
do have an MM-3 keyer) is to disassemble the keyboard and shield the
case internally by lining it with Al foil. i'd guess the VHF guys/girls
don't have to worry about shielding at 140MHz and up, but then again
maybe you do with all the computer gear. anybody already got keyboards
cleaned up? (RFI speaking, of course) ;-)

yesterday morning, 6am again, XEW-TV channel 9 coming in on the tube.
in spanish. i'd guess Mexico City, am i even close? again channels
2-34 from all over coming in. all you VHF guys/girls outta be having
a blast working DX in the ultraviolet! :-)

Assuming you'd use AM on CB as most do, I think you'll find that you'll get only about 40 watts carrier out of a typical "100 watt" HF rig. All HF rigs I've seen in the last 20 years or so generate AM by inserting the carrier back into a SSB signal, i.e., this isn't the efficient high level modulation used in homebuilt 75 AM rigs or broadcast transmitters.

I have no idea what 40 watts carrier would be in PEP power, since PEP is such a silly way to measure emission types that have a carrier like AM, CW, and FM. Oh, by the way, last time I checked (which was years ago), the CB power limits were 5 watts DC input to the final, and 4 watts carrier output. I wonder how many of the Class C PAs used in CBs are 80 percent efficient...

The best source of collective information for the Minisport is the
MiniSport Laptop Hacker series distributed in the comp.sys.zenith and
rec.radio.amateur.packet newsgroups. ..I'm not biased :)

Have you tried directly connecting to the wall power and see that it
works fine? Many power supplies are failing (which would show up
in both cases), but you have the first dead battery I've heard of.

: Warren - You didn't say what values you tried. I found that with a PacComm Tiny-2
: (quite a nice box) I required a resistor no larger than 2.7K to get my DJ-580
: to key. As I recall, the recommended value was 5K, but that didn't work. I
: didn't fool around with a capacitor, and I didn't use the recommended 3-pin
: connector (available where?), so I'm probably wasting some power by shorting
: the mike power limiting resistor to ground. But it keys fine, it runs for a
: long time on a battery charge, and the radio doesn't get very hot. Try a smaller
: pull-down resistor. (Not too small, though!)
:
: AXM
: kd1ik

I use a 25k resistor with a TNC2S, no caps. It probably depends on the switch
in the TNC. If it's a bipolar it may need a lower resistor tham with a
FET or relay (lower on-resistance)

That's a BBB (big bunch of baloney). The 5V are connected through a 100 Ohms
resistor to the connector. Now figure (5*5)/100 thats 250 mW. Its quite hard
to damage an SMD-resistor or even the 5V regulator with that.

The 250 Hz filter I am using does a great job. It is not too narrow to
make copying high speed code (30-50 wpm) difficult, but it reduces qrm
quite a bit. I always have to wonder when the other om talks about qrm
what he is talking about until I go to a higher bandwidth.
Tuning is no problem at all.

I agree completely. I would even say that it is easier to do hombrew-
projects with SMD components, especially at high frequencies. Everything
is smaller and has less parasitics.

I have been very pleased with my DJ-F1T - the only problem is that now I wish I had UHF too. I bought the HP variant, and am also pleased with that. I have run off a bench power supply at 5W for a while with the battery off the back and it got quite warm but not to where I couldn't hold it. I have both the 9V alkaline pack and the 12 V nicad - when I go out backpacking or some other activity where I will be a long distance away, I tend to use the 9V pack for routine work and keep the 12V pack just in case I really need to be sure and get out - the increased power is sometimes needed to get clear communications when the 9V just won't quite make it.

The radio is quite rugged but I haven't tried running over it with my car yet. The best I have done is drop it in the parking lot while fumbling for my keys. Programming isn't too hairy - I have a laminated copy of their crib sheet that I keep handy most of the time but I very seldom have to refer to it. The keys are labelled nicely but are completely invisible at night since the internal light backlights the keys but the labels are on the case. I have made the extended receive (AM aircraft) modification and it switches mode fast enough that it can scan over a mixture of AM and FM channels. The wide-band gain is good enough that I get very good reception on the weather bands. Aircraft seems to be okay but I haven't really tested it to see how well it works (distance, quality, etc).

If you are looking for a VHF-only rig the DJ-F1T is quite nice.

Bryan, KB7TEW, peterson@physc1.byu.edu

: > Thanks,

: > Russ Curry
: > (curry@sctc.com)

: Hello Russ,
: I've got an HT with 2.5W out using the built-in battery. Under normal
: conditions, about 10 miles is all I can really count on getting a readable
: signal out. I can hit a repeater about 20 miles from me but that's only
: "hitting" it. With an external battery to get the HT's full 5W output and
: an external homemade j-pole antenna, I have talked to a station simplex about
: 90 miles during a band opening. BTW, my HT is a Kenwood TH-28A. I'm not
: sure where you're QTH is, but, around the southern part of the country, there
: have been some mojor band openings on 2m the last few nights/mornings.

: 73, Jason

Gents:

In my experience, there are three factors affecting how far you can get with an HT (or any other radio for that matter): By far the most important is the height of the antenna (when I'm on my roof, working on the A/C, the HT can hit repeaters 40 miles away "full quieting" with a mere 2W, and they come in at S9+, with just the "rubber dummy load" antenna). The next most important thing is the antenna. With a 5/8wave end-fed telescoping antenna, (i.e., an AEA Hot-Rod), I can carry on conversations on repeaters over 100 miles away, though it is very sensitive to my location (i.e., nearest building is over 1 mile away in the direction of the repeater, and the repeater is on a high mountain), and it is about 70% quieting (and about S6 on my meter), again this is at two watts. Last and least important factor is power. From the back yard of my house, I need both the "Hot Rod" and 5W out to bring in the repeaters I can hit with rubber-leaky-dummy-load from the roof.

Generally these are wired using an earth leakage circuit breaker, a device that is quite common over here (don't know about over there) that cuts of the mains if a leakage to earth occurs, i.e. if you're strapped across it. A leakage as low as 30mA will cause the trip to do it's stuff.

From that, it's quite easy to have a button that needs to provide 30mA to earth from the live to trip, in the case of the UK ISTR a resistor of 13k works fine.

I have to say I don't fully appreciate your mains system in the USA, if it's double insulated there could be other problems with this system, but generally over here it's done as above. Given it requires no extra wiring, and can be installed wherever there's a socket.
